INTRODUCTION TO INDUSTRIAL HYGIENE ENGINEERING AND CONTROL (552)

This is a modularized course designed for use as a one, two, or three week short course or as a one or two semester academic course at either the undergraduate or graduate level. It examines the fundamentals for design of controls to eliminate or satisfactorily deal with occupational health hazards. Lectures, augmented by problem solving sessions, are intended to assist the trainee in selecting, designing, and applying control methods in the work environment. Primary attention is given to industrial ventilation, noise and vibration control, heat stress, and industrial illumination as well as new engineering topics.

The training course manual has been specially prepared for the trainees attending the course and should not be included in reading lists of periodicals as generally available.

FACULTY AND STAFF

DIVISION OF TRAINING AND MANPOWER DEVELOPMENT

Dr. Alan D. Stevens	Director
James S. Ferguson	Deputy Director
Dr. N. Jack Berberich	Chief, Curriculum Development Branch
Edward D. Leininger	Chief, Direct Training Branch
Dr. Thomas C. Purcell	Chief, Educational Resource Development Branch
Stephen G. Bayer	Training Instructor
Dr. David E. Clapp	Safety Engineer/Instructor
John M. Blankenhorn	Industrial Hygienist
Larry W. DeArmond	Training Technician
Steven N. Dereniuk	Chemist
Horace E. Dimond	Safety Engineer
Ruth A. Duffy	Secretary
Pauline J. Elliott	Visual Information Specialist
Denise Gerth	Secretary
Joyce Huff	Secretary
Bernadine B. Kuchinski	Occupational Health Nurse Consultant/Educator
Judith A. Kuethe	Secretary
Laura Love	Secretary
Carl H. Moline	Industrial Hygienist
Sharon Moreland	Secretary
Dr. Paul D. Pedersen	Medical Officer
William H. Perry	Industrial Hygiene Chemist
Jane A. Raber	Grants Assistant
Dr. Pantelis G. Rentos	Training Grant Program Officer
Richard C. Robbins	Motion Picture Specialist
Joann R. Schloemer	Consulting Nurse
Raymond C. Sinclair	Television Production Specialist
Linda Smith	Secretary
Anne M. Stirnkorb	Visual Information Specialist
Marsha Striley	Secretary
David S. Thelen	Training Grants Coordinator
Linda Tull	Secretary
James B. Walters	Public Health Advisor
Kathleen Watkins	Staff Assistant
Robert B. Weidner	Senior Industrial Hygiene Consultant
William J. Weis	Manpower Specialist
Donna Welage	Staff Assistant
Roger L. Wheeler	Electronics Engineer
Glenda M. White	Audio Visual Production Officer
John M. Yacher	Chemical Engineer/Training Officer

FOREWORD

The material presented in this document is designed for use in a college or university classroom and is directed to students at an advanced level of study in industrial hygiene. The course may also be utilized in total or in part as the basis for short course offerings.

This material was developed under sponsorship of the National Institute for Occupational Safety and Health, Division of Training and Manpower Development, Cincinnati, Ohio, (Contract CDC-210-75-0076). Serving as Project Officer for the development of this material was Robert B. Weidner, J.D., Branch Chief, Division of Training and Manpower Development.

The lesson plans and accompanying text entitled *Industrial Hygiene Engineering and Control* were prepared by the staff of Management Resource Associates, Monroeville, Pennsylvania. Serving as authors were Bruce B. Byers, Ronald J. Hritz, and James C. McClintock. Also assisting, as consultants to the development of the materials, were Ralph J. Vernon, Ph.D., and Richard B. Konzen, Ph.D., of Texas A&M University.

Art work for the text was prepared by Carole D. Byers. Manuscript preparation was the responsibility of Elaine S. Holmes.

INTRODUCTION

Purpose of the Course

The course materials are designed for presentation to students at the baccalaureate or graduate level of study in Industrial Hygiene. The materials presuppose that the student has completed introductory courses in recognition, measurement, and evaluation of occupational health hazards. The materials are designed in such a manner that they are applicable as a two-semester course or a three-week intensive study short course. In addition, the materials may be divided to provide courses of a shorter duration. Since the course is divided into self-contained modules, each module can be used as the basis for the development of a course. (e.g., Module 2, Industrial Ventilation can be utilized as a one-semester offering or a one-week short course.)

The emphasis in each module is the control of occupational hazards. However, this emphasis does not preclude the inclusion of recognition, measurement and evaluation topics within the module. Summary material covering these important areas is included where appropriate within each module. This inclusion is based upon the authors' belief that problem identification and definition are important steps that must be taken before adequate control can be implemented.

Content

The materials are divided into eight (8) self-contained modules. Each module is divided into units and lessons. For the most part, the lessons are based upon a one-hour class session for presentation. The modules that are included, as well as the *minimum* time available to cover the modules are:

<i>Module</i>	<i>Title</i>	<i>Minimum Time</i>
1	Introduction to Industrial Hygiene Engineering and Control	7 Hours
2	Industrial Ventilation	31 Hours
3	Thermal Stress	4 Hours
4	Sound	7 Hours
5	Industrial Illumination	3 Hours
6	Nonionizing and Ionizing Radiation	8 Hours
7	Ergonomics	5 Hours
8	Other Topics	7 Hours
Total Time		<u>72 Hours</u>

The time allotted is a minimum time that does not include allowance for testing and review of problems and exercises. Based upon the experiences gained in a pilot test of the materials, the time allotted above provides for only a brief coverage of the topics included. For thorough coverage of each subject, the allotted time should be increased to at least 120 hours. In any case, the time required is dependent upon the level of detail and completeness of coverage of each topic that is desired.

Course Prerequisites

The students should have taken courses in recognition, measurement and evaluation of occupational health hazards. At a minimum, the students should have completed the following NIOSH sponsored courses or their equivalent:

- Recognition, Evaluation and Control of Occupational Hazards
- Industrial Hygiene Measurements

In addition, the students should have completed education in undergraduate mathematics through the calculus and undergraduate science including general and organic chemistry, physics, and biology. Additional engineering courses such as fluid mechanics and thermodynamics will be helpful to the student.

Components of the Course

The Course Manual is designed to provide the technically competent instructor with the basic educational materials from which to conduct the training sessions. It is not the purpose of the Course Manual to provide a complete skill and knowledge package from which the instructor can obtain the technical competency necessary to conduct training, since such competence is assumed to be an attribute of any instructor chosen to teach in the program. Should the instructor wish to brush up on certain skills and knowledge, the references cited as well as the accompanying text, *Industrial Hygiene Engineering and Control*, will provide a basis for this undertaking.

The course is organized with three (3) basic elements. These elements are:

1. **Module**—A complete, self-contained package of educational materials that is directed toward the attainment of skills and knowledge in a subject area. These modules can be presented as a stand-alone course or can be combined in various ways to construct courses for use with selected groups of students.
2. **Unit**—A self-contained package of educational materials that is directed toward attainment of a subset of skills and knowledge in a subject area. The unit does not necessarily lend itself to use as a stand-alone package since certain segments of the skills and knowledge presented depend upon completing previous units within the module.
3. **Lesson**—Generally, an artificial segmentation of a unit for administrative purposes. Lesson segments are normally one hour in length and, as far as is practical, cover a logical subset of knowledge or skills. Lessons allow for the scheduling of the training in various educational environments.

Instructor's Manual—The Module Plan

The module plan contains the following components:

1. **Unit and Lesson Topic Outlines**—This outline presents the topics covered within the module and the schedule for presentation of these topics. This information provides a concise and organized summary of the subject material in the module.
2. **Terminal Objectives**—General competency statements related to the skills and knowledge that should be possessed by the student upon completion of

the module. The skill objectives relate to the manipulative, computational, or decision-making skills that the student should attain upon completion of the module. The knowledge objectives relate to the subject knowledge that the student requires in order to perform the required skills. These objectives serve as a basis upon which an evaluation can be made of the student's mastery of the subject material included in the module.

3. Self-Tests—Postmodule self-tests along with the correct answers to these tests are included with each module.
4. References—A list of reference material can be consulted by the instructor or students.

Instructor's Manual—The Unit Plan

The unit is made up of a number of specific components and contains the lesson content outline. The components of the unit plan are:

1. Performance Objectives—Skill and knowledge objectives related to the subject matter included within the unit. These objectives are written in behavioral terms (i.e., an observable activity or result that can be evaluated quantitatively, as specified, and which is conducted or obtained under specific conditions). The objectives that are presented within the unit plan are of a more specific nature than those terminal objectives or competency statements that are specified by the module plan. The performance objectives presented within the unit might be thought of as enabling objectives; i.e., they represent the skills and knowledge that the student must attain in order to complete the requirements of the terminal objectives for the module.
2. Unit Activities—Activities that the student must perform to complete the unit. Reading assignments, reference materials, and outside activities are presented.
3. Required Facilities, Equipment, and Materials—Materials—The required facilities, equipment and materials that should be available for presentation of the unit. The equipment and materials listed are divided into those which are educational and those which are content oriented (e.g., 16 mm projector vs. pitot tube).
4. Content Outline—Presents an organized outline of the topics to be covered during the presentation of the unit. The content outline is divided into the lesson outlines necessary for completion of the units.

In addition, the content outline contains instructions to the instructor and reference to slides and overlays that should be used in conjunction with the lecture. These instructions present the sequence of instructor activities, such as when to present a given slide, when a demonstration is required, or when an instructor's experience might be of value.

Since the course is designed to be taught by technically competent instructors, the material in the lesson content outline is of a topical nature with only that explanation present that should be emphasized to the student. It is expected that the instructor's skill and knowledge will allow for the depth

of presentation and emphasis required. The instructor is encouraged to present material relevant to experience, wherever possible, in order to provide the students with a referent to the subject.

5. Demonstration Outlines—Appropriate outlines for classroom and laboratory demonstrations and sample problems to be presented to the class. The demonstrations are designed to present an outline of the procedural steps that are important in performing the particular measurement, design, or calculation. Steps that are critical or that may lead to common errors are emphasized in the demonstration outlines.
6. Practice Exercises—A series of practice exercises that can be given to the student. These practice exercises can be used as either classroom or laboratory exercises or as homework assignments. Solutions to problems involving calculations are also provided.

Audio Visual Aids

A set of slides, which are referenced in the lesson outlines, have been prepared and are available for use in presenting the course.

MODULE 6

NONIONIZING AND IONIZING RADIATION

INSTRUCTOR'S MANUAL

Unit and Lesson Topic Outline

Nonionizing and Ionizing Radiation

Module 6

The topics listed below are included within this module. The recommended time to be allotted for each topic is also given. Depending upon the particular class, this time may vary slightly; however, the total time for the entire module should not exceed the time given.

Unit	Lesson		Time/hrs.
1	1	Nonionizing Radiation	
	1	Principles of Nonionizing Radiation	2
	2	Control of Nonionizing Radiation	1
2	2	Ionizing Radiation	
	1	Principles of Ionizing Radiation	2
	2	Monitoring Instruments	1
	3	Control of Ionizing Radiation	2
Total Module Time--8 Hours			

Terminal Objectives

Nonionizing and Ionizing Radiation

Module 6

The objectives presented represent the competencies that the student should possess upon completion of this module. All objectives are directed toward the student's obtaining certain category levels of skill and knowledge.

Terminal Objectives

1. Upon request, the student will be able to write a paragraph that describes the properties of electromagnetic radiation.
2. Upon request, the student will be able to describe the difference between ionizing and nonionizing radiation.
3. Upon request, the student will be able to write a paragraph describing each type of radiation listed. The description will include the source, general application or use, biological effect, and protective measures normally taken to protect against each type of radiation.
 - a. ultraviolet radiation
 - b. infrared radiation
 - c. microwave radiation
 - d. alpha particles
 - e. beta particles
 - f. X-radiation
 - g. gamma radiation
 - h. neutrons
4. Given a situation describing the use of a nonionizing radiation source that is potentially dangerous, the student will be able to
 - a. identify the radiation hazard
 - b. recall at least two associated hazards related to the specified source
 - c. describe the procedures necessary to further analyze the potential hazard
 - d. using any references selected by the student, outline a procedure for minimizing or removing the hazard

Terminal Objectives	
Nonionizing and Ionizing Radiation	Module 6
<p>5. Given a situation describing the use of an ionizing radiation source and any references selected by the student, the student will be able to</p> <ul style="list-style-type: none"> a. calculate the potential radiation hazard. b. outline the procedure for controlling and monitoring the hazard. The outline must include a discussion of: <ul style="list-style-type: none"> (1) shielding requirements (2) changes in operating procedures (3) protective equipment used for personnel (4) changes in facilities design (5) monitoring procedures (including instrumentation) to be implemented (6) control of waste disposal (if applicable) <p>The description will include:</p> <ul style="list-style-type: none"> a. type and amount of radiation source b. description of the operating procedures and use of the radiation source c. present protective equipment and procedures being implemented d. location of personnel with respect to radiation source and mean exposure time of each of the personnel e. sample readings taken at the location of each of the personnel f. dimensions of the room g. any control devices presently being used that are not radiation oriented (e.g., ventilation systems)

UNIT 1

NONIONIZING RADIATION

Performance Objectives		
Lesson	Nonionizing Radiation	Module 6 Unit 1
1	1. Given a list of statements, the student will be able to recognize the one that best defines <ul style="list-style-type: none"> a. photon b. wavelength c. frequency d. relationship between wavelength and frequency 1. Given a list of regions on the electromagnetic spectrum, the student will be able to recognize the relative location of the region with respect to the other regions listed based upon frequency; e.g., ultraviolet has a higher frequency than infrared. 1. Given a list of statements, the student will be able to select the one that best defines <ul style="list-style-type: none"> a. nonionizing radiation b. ionizing radiation c. relationship of ionizing and nonionizing radiation 1. Given a list of statements, the student will be able to recognize the statement that best describes <ul style="list-style-type: none"> a. region of electromagnetic spectrum b. potential sources for the radiation c. biological effects, including critical organ for each of the following regions: <ul style="list-style-type: none"> 1. ultraviolet 2. infrared 3. radio frequency (microwaves) 1. Given any references of the student's choice, the student will be able to determine the threshold limit value for a specified wavelength in the <ul style="list-style-type: none"> a. ultraviolet region b. infrared region c. radio frequency region 1. Given a list of statements, the student will be able to recognize the one that best describes the principle of operation of the <ul style="list-style-type: none"> a. klystron b. magnetron 1. Given a list of statements, the student will be able to recognize the one that best describes the principle of operation of a laser. 1. Given no aids, the student will be able to recall and describe why lasers present a potential hazard.	

Performance Objectives	
Lesson	Module 6 Unit 1
	Nonionizing Radiation
1	9. Given a list of statements, the student will be able to recognize the one which best defines the difference between a CW and a pulsed laser.
1	10. Given the <ul style="list-style-type: none"> a. output power b. pulse length c. focal size the student will be able to calculate the power density generated by a laser.
1	11. Given no aids, the student will be able to recall at least one source and three related hazards for ultraviolet, infrared, and radio frequency regions.
1	12. Given no aids, the student will be able to recall at least two uses and three related hazards for a laser.
2	13. Given a list of statements, the student will be able to recognize the one(s) which best describe the principle of operation of ultraviolet detection devices; e.g., photon and thermal.
2	14. Given a list of statements, the student will be able to recognize the one which best describes the need for ultraviolet survey instruments approximating the ultraviolet actinic curve.
2	15. Given a series of incremental measurements from an ultraviolet source, a table of relative spectral effectiveness by wavelength, and the TLV table for effective irradiance, the student will be able to calculate the effective irradiance and if the TLV has been exceeded for a specified exposure time.
2	16. Given a list of statements, the student will be able to recognize the one(s) which best describe factors affecting the accurate measurement of ultraviolet radiation.
2	17. Given no aids, the student will be able to recall the effect of time and distance upon exposure level of electromagnetic radiation.
2	18. Given a description of a work situation, including the exposure rate of ultraviolet radiation, the student will be able to calculate the maximum permissible time of exposure based upon the TLV.
2	19. Given a situation describing the exposure level for specified wavelengths of ultraviolet radiation and a table of eyewear specifications, the student will be able to select the eyewear which attenuates the exposure below TLV for the given situation.
2	20. Given the power output, beam divergence, beam diameter, and a formula to calculate beam intensity, the student will be able to calculate the beam intensity of a selected laser.

Performance Objectives		
Lesson	Nonionizing Radiation	Module 6 Unit 1
2	21. Given a list of statements, the student will be able to recognize the one(s) which best describe(s) the principle of operation of laser survey instruments; e.g., photon, thermal.	
2	22. Given no aids, the student will be able to recall the criteria for classifying lasers in the five categories.	
2	23. Given a list of statements, the student will be able to recognize the one(s) which correctly define(s) operational requirements for a specified class of lasers; e.g., Class I--no requirements.	
2	24. Given a situation describing the exposure level for specified wavelengths of a laser and a table of eyewear specifications, the student will be able to select the eyewear which attenuates the exposure below TLV for the given situation.	
2	25. Given a list of statements, the student will be able to recognize the one which best describes the difference between the "near" and "far" field of radio frequency radiation.	
2	26. Given the antennae area and wavelength (radio frequency), the student will be able to calculate the radius of the near field.	
2	27. Given a list of statements, the student will be able to recognize the one(s) which best describe(s) the principle of operation of microwave detection devices; e.g., photon and electrical.	
2	28. Given no aids, the student will be able to recall at least five (5) potential hazards of radio frequency radiation to be evaluated.	

Unit Activities--Instructor	
Nonionizing Radiation	Module 6 Unit 1
<p>In order to present the unit material to the students, the instructor will be responsible for the following activities:</p>	
<p><u>Lesson 1--Principles of Nonionizing Radiation</u></p>	
<p><u>Classroom Presentation</u></p>	
<p>Conduct a discussion concerning the basic theory of nonionizing radiation. Specifically, ultraviolet, infrared, radio frequencies, microwaves, and lasers should be discussed. Also included is a discussion of the applications and related hazards.</p>	
<p><u>Time Allotted</u></p>	
<p>2 Hours</p>	
<p><u>Demonstrations</u></p>	
<p>No demonstrations are required.</p>	
<p><u>Supervised Practice</u></p>	
<p>No supervised practice is required.</p>	

Unit Activities--Instructor	
Nonionizing Radiation	Module 6 Unit 1
<u>Lesson 2--Control of Nonionizing Radiation</u>	
<u>Classroom Presentation</u>	
Present a lecture on controlling nonionizing radiation. Specifically, ultraviolet radiation, microwave radiation, and lasers are discussed. Emphasis should be placed upon general concepts of control.	
<u>Time Allotted</u>	
1 Hour	
<u>Demonstrations</u>	
No demonstrations are required.	
<u>Supervised Practice</u>	
No supervised practice is required.	

Unit Activities--Student

Nonionizing Radiation

Module 6
Unit 1

In order to complete the unit successfully, the student will be responsible for the following:

Lesson 1--Principles of Nonionizing Radiation

Classroom Activity

Attend a lecture concerning the basic theory of nonionizing radiation.

Assignment

The student should review the following materials prior to attending class.

READING	SHORT COURSE	EXTENDED 1-HOUR
Industrial Hygiene Engineering and Control		Section 6 Chapter 1
the Industrial Environment--its Evaluation and Control		Chapter 28 pp. 357-376
PROBLEMS		
Self-Test	Section 5	Section 5

Unit Activities--Student

Nonionizing Radiation

Module 6
Unit 1

In order to complete the unit successfully, the student will be responsible for the following:

Lesson 2--Control of Nonionizing Radiation

Classroom Activity

Attend a lecture on the control of nonionizing radiation.

Assignment

The student should review the following materials prior to attending class.

Principles of Nonionizing Radiation	Module 6 Unit 1 Lesson 1
TOPIC	REMARKS
<p>I. Introduction</p> <p>A. Prior Module--Discussed Visible Radiation--Light</p> <ol style="list-style-type: none"> 1. Light has characteristics of waves and particles. 2. Light is energy released from de-excitation of electron. 3. Energy released in discrete units--quantum of energy--photon. 4. Each wave in visible spectrum has a characteristic: <ol style="list-style-type: none"> a. wavelength b. frequency c. photon energy 5. Characteristics can be correlated using the following: <ol style="list-style-type: none"> a. $C = f\lambda$, where $C = \text{speed of light}$ $(3 \times 10^{10} \text{ cm/sec})$ $f = \text{frequency of oscillations/sec}$ $\lambda = \text{wavelength (cm)}$ b. $E = hf$, where $E = \text{photon energy (Joules)}$ $h = \text{Plank's constant}$ $(6.6 \times 10^{-34} \text{ Joule/sec})$ $f = \text{frequency of oscillations/sec}$ 6. The importance of visible radiation--eye sensitive to this spectrum regions. <p>B. Electromagnetic Spectrum</p> <ol style="list-style-type: none"> 1. All radiations fundamentally alike in that they are produced by moving electrical charges. 2. Movement can be molecules, electrons, neutrons, etc. 	<p>Slide 6.1.1.--Radiation</p> <p>Briefly review topics discussed in last module which dealt with electromagnetic radiation.</p> <p>Slide 6.1.1.2.--Relationship of Frequency, Wavelength, and Photon Energy</p> <p>Slide 6.1.1.3.--Electromagnetic Spectrum</p>

Lesson Outline		
Principles of Nonionizing Radiation		Module 6 Unit 1 Lesson 1
TOPIC	REMARKS	
3. All radiation has same basic properties of visible radiation. II. Radiation--Overview A. Radiation--Emission of particles or energy in wave form. B. Vary in wavelength (λ) and frequency (f). C. Units of Measure 1. Wavelength a. length from peak to peak b. units--see slide 2. Frequency a. oscillations per second b. units--see slide 3. Unit prefixes--used in conjunction with basic units.		
TABLE OF UNIT PREFIXES		
Multiples and Submultiples	Prefix	Symbol
1,000,000,000,000 = 10^{12}	tetra-	T
1,000,000,000 = 10^9	giga-	G
1,000,000 = 10^6	mega-	M
1,000 = 10^3	kilo-	k
100 = 10^2	hecto-	h
10 = 10^1	deka-	D
0.1 = 10^{-1}	deci-	d
.01 = 10^{-2}	centi-	c
.001 = 10^{-3}	milli-	m
.000001 = 10^{-6}	micro-	μ
.000000001 = 10^{-9}	nano-	n
.00000000001 = 10^{-12}	pico-	p

4. Energy <ul style="list-style-type: none"> a. joule--work done when a constant force of 1 meter moves a body 1 meter b. erg--work done when a constant force of 1 dyne moves a body 1 centimeter $1 \text{ joule} = 10^7 \text{ ergs}$ <ul style="list-style-type: none"> c. electron volt--energy acquired by a body whose charge equals that of an electron when body falls through a potential difference of one volt $1 \text{ eV} = 1.602 \times 10^{-19} \text{ joules}$	Slide 6.1.1.7.--Units of Measure--Energy	
5. Energy density. <ul style="list-style-type: none"> a. above units over a unit area b. e.g.,--joules/cm² 		
6. Power <ul style="list-style-type: none"> a. unit work divided by time b. e.g., --watt = joules/second 		
D. Spectrum is divided into regions <ul style="list-style-type: none"> 1. Radio frequency 2. Microwave 3. Infrared 4. Visible 5. Ultraviolet 6. X-rays 7. Gamma rays 	Slide 6.1.1.8.--Electromagnetic Spectrum	
E. Radiation also exists which is not electromagnetic in nature but particulate. <ul style="list-style-type: none"> 1. Formed from radioactive decay or nuclear reaction. 2. Have high energy necessary for ionization (discussed later). 	Review the spectrum with the students. Identify the boundaries and possible source for each region.	
	Slide 6.1.1.9.--Particulate Radiation	
	Identify types of particulate radiation briefly for students. It will be discussed later.	

Lesson Outline	
TOPIC	REMARKS
<p>Principles of Nonionizing Radiation</p> <p>3. Types</p> <ul style="list-style-type: none"> a. alpha--helium nucleus b. beta--electrons c. neutrons <p>F. Radiation can be divided into two segments.</p> <ol style="list-style-type: none"> 1. Ionizing vs. nonionizing. 2. Based upon photon energy available. 3. Definition. <ul style="list-style-type: none"> a. ionizing--removal of electron from atom, forming positive and negative ion b. nonionizing--energy sufficient to excite atoms but not sufficient to remove electron <p>4. Known that 10 electron volts (eV) required to cause ionization of oxygen or hydrogen molecule; 10 eV can be set as lower limit for ionizing energy.</p> <p>5. Using the equations.</p> $E = hf$ $C = f\lambda$ <p>The minimum wavelength can be determined which causes ionization.</p> $E = hf \quad C = f\lambda$ $\therefore E = \frac{Ch}{\lambda} \text{ or } \lambda = \frac{h \cdot C}{E}$ $\lambda = \frac{(6.6 \times 10^{-34} \text{ joule-sec}) \left(\frac{3.0 \times 10^{10} \text{ cm}}{\text{sec}} \right)}{10 \text{ eV} \cdot 1.602 \times 10^{-19} \text{ joules}}$ $\lambda = 1.24 \times 10^{-5} \text{ cm}$	<p>Module 6 Unit 1 Lesson 1</p> <p>Slide 6.1.1.10.--Ionizing vs. Nonionizing Radiation</p> <p>Ask students if they are familiar with "electron volt" as a unit of energy (force). If they are not, explain terminology.</p> <p>Slide 6.1.1.11.--Calculation of Minimum Ionization Wavelength</p>

Lesson Outline	
Principles of Nonionizing Radiation	Module 6 Unit 1 Lesson 1
TOPIC	REMARKS
<p>6. Therefore, all radiation with λ greater than 1.24×10^{-5} cm will be considered non-ionizing, including</p> <ul style="list-style-type: none"> a. ultraviolet b. visible c. infrared d. radio frequency e. microwave 	<p>Slide 6.1.1.12.--Electromagnetic Spectrum Ionizing vs. Nonionizing Radiation</p> <p>Review the areas of the spectrum that are categorized ionizing and nonionizing with the students.</p> <p>Inform students that each segment of ionizing and nonionizing radiation will be presented in detail.</p>
<p>III. Nonionizing Radiation--General</p> <p>A. Definition--Radiation with sufficient energy to cause excitation of electrons, atoms, or molecules but insufficient energy to cause ionization.</p> <p>B. Characteristics</p> <ul style="list-style-type: none"> 1. All electromagnetic radiation. <ul style="list-style-type: none"> a. caused by moving charges b. electrical field with accompanying magnetic field 2. Waves vary. <ul style="list-style-type: none"> a. wavelength (λ) b. frequency (f) c. intensity-strength--varies inversely with distance (d) by a factor of $1/d^2$--(inverse square law) 3. Radiation can be considered in some instances discrete particles. <ul style="list-style-type: none"> a. quantum of energy--discrete energy and momentum b. if λ increases, energy decreases 	<p>Slide 6.1.1.13.--Nonionizing Radiation--Definition</p> <p>Slide 6.1.1.14.--Nonionizing Radiation Characteristics</p> <p>This section is a review of characteristics presented for all radiation.</p>

Lesson Outline	
Principles of Nonionizing Radiation	Module 6 Unit 1 Lesson 1
TOPIC	REMARKS
4. No sharp dividing lines between regions--arbitrarily established.	
C. Sources	Slide 6.1.1.15.--Nonionizing Radiation--Sources
1. Come from variety of sources.	
a. designed--microwave unit	
b. by-product--welders arc	
2. Examples.	Ask students to give examples of each type of radiation listed.
a. radio frequency--oscillating electrical current	
b. infrared--heated bodies--rotation of atoms	
c. visible--electron transition of energy levels	
3. Source of nonionizing radiation usually gives off more than one frequency.	
a. sun vs. welder's arc--broad band source	
b. radio antennae--must be filtered but essentially narrow band source	
D. Biological Effects	Slide 6.1.1.16.--Nonionizing Radiation--Biological Effects
1. Eye.	
a. very sensitive to radiation injury; e.g.,	
(1) conjunctivitis	
(2) keratitis	
b. not equally sensitive to all wavelengths--e.g., visible vs. ultraviolet	
c. can be indicator of radiation exposure because of sensitivity	
2. Thermal effect--body's absorption of nonionizing radiation causes heating of tissue.	

Lesson Outline	
Principles of Nonionizing Radiation	Module 6 Unit 1 Lesson 1
TOPIC	REMARKS
<p>3. Photochemical--causes chemical changes in body; e.g., development of pigment in skin from exposure to sun.</p> <p>4. Carcinogenic--may catalyze tumors or cancer.</p> <p>IV. Nonionizing Radiation--Specific Regions</p> <p>A. To Be Discussed</p> <p>1. Ultraviolet.</p> <p>2. Visible.</p> <p>3. Infrared.</p> <p>4. Radio frequencies.</p> <p>5. Microwaves.</p> <p>6. Lasers.</p>	
	Inform students that this section will deal with
	<p>a. characteristics</p> <p>b. sources/application</p> <p>c. biological effects</p> <p>d. permissible exposure limit values</p>
	for each region.
<p>B. Ultraviolet Region</p> <p>1. Highest energy region of the nonionizing radiation.</p> <p>2. Normally divided into three regions.</p> <p>a. vacuum</p> <p>(1) $< 1.6 \times 10^{-5}$ cm (160 nm)</p> <p>(2) radiation can exist only in a vacuum</p> <p>(3) radiation completely absorbed by air</p> <p>b. far</p> <p>(1) $1.6 - 3.2 \times 10^{-5}$ cm (160-320 nm)</p> <p>(2) for λ</p> <p>--160-200 nm poorly transmitted through air</p> <p>--200-320 nm absorbed by ozone layer</p>	<p>Slide 6.1.1.17.--Ultraviolet Radiation Spectrum</p>

Lesson Outline	
Principles of Nonionizing Radiation	Module 6 Unit 1 Lesson 1
TOPIC	REMARKS
<p>c. near</p> <p>(1) $3.2\text{--}4.0 \times 10^{-5}$ cm (320-400 nm)</p> <p>(2) transmits through air particularly through glass</p> <p>d. most critical range is between 240-320 nm; highest biological effect in this range.</p> <p>3. Sources of ultraviolet radiation.</p> <p>a. sun</p> <p>(1) primarily radiation from middle and near region</p> <p>(2) typical solar radiation on a midsummer day, temperate latitude</p> <p>--total ultraviolet-daily cumulative dose ($\lambda < 400$ nm) = 2×10^{-3} J/cm²</p> <p>--only 1×10^{-5} J/cm² is erythemally effective (explained later)</p> <p>b. incandescent, fluorescent light sources</p> <p>c. welding operations</p> <p>d. plasma torches</p> <p>e. lasers</p>	Slide 6.1.1.18.--Sources of Ultraviolet Radiation
4. Applications	Ask students to give examples of uses of ultraviolet radiation and related hazards.
a. food sterilization--germicidal lamp	Have students explain setup for process they are discussing. If necessary, draw diagram on chalkboard.

Lesson Outline	
TOPIC	REMARKS

Lesson Outline		
Control of Nonionizing Radiation		Module 6 Unit 1 Lesson 2
TOPIC	REMARKS	
II. Lasers	Slide 6.1.2.18.--Lasers	
A. Hazard		
1. Reason for hazard--concentration of energy on a point target.		
2. Predominately affects	Slide 6.1.2.19.--Observing Laser Light	
a. eye--parallel rays may be focused to a point image		
b. skin		
3. TLV established for eye and skin.		
B. Measurement of Laser Beam		
1. Number of periodic measurements not necessary for protection program because		
a. accuracy of manufacturers' specifications		
b. high cost of detectors		
c. complexity of radiometric measurement techniques		
2. Possible to beam intensity (I) at a selected range.	Slide 6.1.2.20.--Beam Intensity	
a. must know		
(1) power output (E) in watts		
(2) range of interest (r) in centimeters		
(3) beam divergency (ϕ) in radians		
(4) beam diameter (a) in mm		
b. formula		
$I = \frac{Ee^{-ur}}{[(\pi/4)(a + r\phi)]^2}$		
		Note: (e^{-ur}) is atmospheric attenuation and can be ignored if range less than 10 kilometers.
		r = range in cm
		u = attenuation/cm

Lesson Outline	
Control of Nonionizing Radiation	Module 6 Unit 1 Lesson 2
TOPIC	REMARKS
<u>Example</u> A typical laser has an initial beam diameter of one inch (2.54 cm), power output of 5 mW, and a beam divergence of 0.1 milliradians (10^{-4} radians). What is the beam intensity at 60 cm? <u>Solution</u> $I = \frac{E}{(\pi/4)(a + r\phi)^2}$ $I = \frac{5\text{mW}}{(\pi/4)(2.54 + 60\text{cm}(10^{-4} \text{ radians}))^2}$ $I = 1.25 \text{ mW at 60 cm}$	Put example on chalkboard. Ask the students if this exceeds the TLV for direct eye exposure (ocular viewing). Assume the laser beam is 1. 312 nm - TLV = 250 mJ/cm^2 2. Exposure is 1 minute (60 sec) Response: $\frac{2.33\text{mJ}}{\text{sec}\cdot\text{cm}^2} \times 60 = \frac{139.8\text{mJ}}{\text{cm}^2}$ $\frac{139.8\text{mJ}}{\text{cm}^2} < \frac{250 \text{ mJ}}{\text{cm}^2}$ <p style="text-align: center;">↑ TLV</p> Therefore, does not exceed TLV.

<p>6. Operational devices.</p> <ul style="list-style-type: none"> a. application of devices b. aperature stop should closely approximate pupil opening--7 mm c. calibration of detector required based on type of laser and wavelength involved d. read-out is instrument specific; may be necessary to convert readings to W/cm^2 <p>C. Control of Hazard</p> <ul style="list-style-type: none"> 1. Control based primarily upon <ul style="list-style-type: none"> a. educating operating personnel b. providing warnings to unsuspecting persons c. engineering design which minimizes hazard 2. For purposes of control, government classifies lasers based upon potential hazard as follows: <ul style="list-style-type: none"> a. Class I--exempt laser devices; may be viewed directly; incapable of producing damaging radiation b. Class II--lower power laser; may be viewed directly for short periods of time only c. Class III--medium power laser; cannot be viewed directly d. Class IV--cannot be viewed directly or have skin exposed to diffusely reflected beam 	<p>Briefly describe various uses for each of the above.</p> <p>Slide 6.1.2.27.--Laser Classes</p>

Lesson Outline	
Control of Nonionizing Radiation	Module 6 Unit 1 Lesson 2
TOPIC	REMARKS
<p>e. Class V--Class II, III, or IV laser contained in protective housing as to be incapable of emitting hazardous radiation</p> <p>3. They have also established operating requirements in general and for each class as follows:</p> <p>a. general operating requirements</p> <ul style="list-style-type: none"> (1) protective housing and interlocks that prevent human access during operation (2) Class III-IV--key activated master control (3) Class II, III, IV-- visible or audible indication of laser emission (4) Class II, III, IV-- controls located outside beam area (5) viewing optics must reduce emission to below TLV levels <p>b. e.g., Class IV lasers</p> <ul style="list-style-type: none"> (1) restricted entry to facility--interlock (2) fail-safe system (3) alarm system (4) panic button (5) good illumination-- 150 footcandles minimum (6) light colored diffuse room surfaces (7) operate by remote control (8) designed to reduce fire hazard, buildup of fumes, etc. 	<p>It is not necessary to cover all class requirements but merely point out protection steps that may be taken.</p> <p>The following illustrate protective procedures and installation requirements for the various classes of lasers.</p> <p>Slide 6.1.1.28.--Class IV Requirements</p>

Lesson Outline	
Control of Nonionizing Radiation	Module 6 Unit 1 Lesson 2
TOPIC	REMARKS
c. e.g., Class III (1) well-controlled area (2) no specular surfaces (3) terminate beam with diffuse material and minimum reflection (4) eye protection for direct beam viewing	Slide 6.1.2.29.--Class III Requirements
d. e.g., Class II (1) posting of signs in area (2) control of beam direction	Slide 6.1.2.30.--Class II Requirements
e. Class I--no requirement	
4. Further, the following guidelines are presented for consideration.	
a. laser attended during all times of operation	
b. personnel educated in opera- tion of laser potential hazards	
c. non-instructed personnel <u>not</u> permitted in laser area	
d. laser equipment and area properly posted	
e. direct viewing should not be done using binoculars or telescope	
f. laser should not be aimed at occupied areas without appropriate shielding	
g. methods of confining laser plumes and laser-induced vaporization should be used	
h. nonreflecting surfaces should surround laser area	
i. beams passing through glass should pass through perpendicularly	
j. beam direction should be controlled and minimized	
k. combustible solvents and materials should be stored away from laser	

Lesson Outline	
Control of Nonionizing Radiation	Module 6 Unit 1 Lesson 2
TOPIC	REMARKS
<p>1. potential non-laser hazards should be considered. (See other side of outline)</p> <p>m. protective eyewear should be provided in any instance where potential exposure is above $1\mu\text{W}/\text{cm}^2$</p>	<p>Put on chalkboard.</p> <p><u>Potential Non-Laser Hazards</u></p> <ul style="list-style-type: none"> a. Voltage sources and leads. b. X-radiation from high-voltage sources. c. Ozone generation from high-voltage sources and ultra-violet radiation. d. Underground electrical equipment, including laser heads and work stations. e. Toxic materials. f. Combustible materials. g. Chemically active materials. h. Cryogenic fluids. i. Inert purging gases. j. Flash-lamp explosion. k. Radiation other than laser beam may also be hazardous. l. Violent interactions can occur during the interaction of laser radiation and materials. Explosions, fires, chemical reactions, brilliant plumes, and toxic emission may occur. m. Mechanical items may break. High-speed mechanical scanners, Q-switches, choppers, and so forth, can fatigue and break. n. Interlocks may fail. o. Accidental discharging of laser can occur. p. Ultraviolet and infrared beams cannot be seen. q. Fallible human beings operate lasers. <p>Will be discussed later more specifically.</p>

*Spectacle Type. †See reference 24.

**Available in goggles or spectacle type.

CAUTION

1. Goggles are not to be used for viewing of laser beam. The eye protective device must be designed for the specific laser in use.
2. Few reliable data are available on the energy densities required to cause physical failure of the eye protective devices.
3. The establishment of engineering controls and appropriate operating procedures should take precedence over the use of eye protective devices.
4. The hazard associated with each laser depends upon many factors, such as output power, beam divergence, wavelength, pupil diameter, specular or diffuse reflection from surfaces,

Lesson Outline	
Control of Nonionizing Radiation	Module 6 Unit 1 Lesson 2
TOPIC	REMARKS
e. using parameters discussed, select appropriate eyewear.	Slide 6.1.2.34.--Laser Eye Protection Chart Have students examine chart in textbook. Briefly review data on chart.
6. Medical surveillance.	Slide 6.1.2.35.--Medical Surveillance
a. medical examination should be given to all personnel working near laser.	
b. examination should include	
(1) ophthalmologic examination	
(2) dermatologic examination	
c. persons with following conditions should not be permitted to work near lasers	
(1) eye disease	
(2) skin problems	
(3) chronic pulmonary or cardiovascular disease	
(4) chronic emotional and mental illness	
(5) hypothyroidism	
(6) diabetes	
(7) pregnancy	
7. Summary.	
a. general hazard	
b. measurement of lasers	
c. control of hazards	
d. eye protection	
e. medical surveillance

Practice Exercise

Control of Nonionizing Radiation

Module 6
Unit 1
Lesson 2

1. Referring to the welding shop defined in the Case Study presented in Module 1, Unit 1, Lesson 2, identify
 - a. Potential radiation and nonradiation hazards
 - b. a plan for measurement and evaluation of potential hazards
 - c. procedure and equipment use which can be implemented to increase personnel protection.

N.T.S.

Process Description

<ol style="list-style-type: none"> 1. Parts are delivered to the welding shop by hand truck. 2. Welding is done to specification on cleaned parts. 3. Some of the galvanized parts are sent to welding. 4. Booths #1 and #2 are used for acetylene cutting and welding using an oxygen assist. 	<ol style="list-style-type: none"> 5. Booth #3 used for gas shielded metal arc welding. Carbon dioxide is used as the gas shield. 6. Parts are moved from welding by cart pulled manually or by forklift.

Performance Objectives		Module 6 Unit 2
Lesson	Ionizing Radiation	
1	8. Given an exposure rate in roentgens or rads, the type of radiation (alpha, beta), and the QF value for each type of radiation, the student will be able to calculate the dose equivalent.	
1	9. Given a list of statements, the student will be able to <u>recognize</u> the one which best defines ionization.	
1	10. Given a list of statements, the student will be able to <u>recognize</u> the one which best describes the lethal dose energy relative to normal cell energy production.	
1	11. Given a list of statements, the student will be able to <u>recognize</u> the one which best describes the difference between the direct and indirect action of radiation.	
1	12. Given a list of statements, the student will be able to <u>recognize</u> the one which best defines <ul style="list-style-type: none"> a. external radiation hazard b. internal radiation hazard and the student will be able to <u>recall</u> one type of radiation which exemplifies each.	
1	13. Given a description of an employee who has received an acute dose of radiation, the student will be able to <u>recall</u> <ul style="list-style-type: none"> a. signs/symptoms of acute whole body radiation b. projected long-term effects of exposure to ionizing radiation. 	
1	14. Given a list of doses (rads), the student will be able to <u>recognize</u> the LD ₅₀ of ionizing radiation.	
1	15. Given an exposure rate (rads or roentgens) for a specified period of time, the QF values, the type of radiation involved, and an MPD table, the student will be able to calculate the dose equivalent and determine if the MPD has been exceeded.	
1	16. The student will be able to <u>recall</u> the definition of <ul style="list-style-type: none"> a. MPD b. MPC 	
1	17. Given a radioactive source with known exposure rate given in dose equivalents, the student will be able to calculate the maximum exposure time for the employee, so that the MPD is not exceeded.	
1	18. The student will be able to <u>recall</u> at least four uses of ionizing radiation. They may include <ul style="list-style-type: none"> a. radiation gauges b. static eliminators c. X-ray analysis d. self-luminous compounds e. tracers 	

Performance Objectives		
Lesson		Module 6 Unit 2
	<p>Ionizing Radiation</p> <p>2 19. Using no references, the student will be able to <u>recall</u> at least three hazards associated with radiation use. The three hazards may be taken from the following list:</p> <ul style="list-style-type: none"> a. direct radiation b. high voltage of associated equipment c. unwanted radiation (e.g., using primarily a beta source which also emits gamma) d. chemical or toxic properties of radionuclide in solution. <p>2 20. Given a list of statements, the student will be able to <u>recognize</u> the statement which best describes the principle of operation of the ionization chamber.</p> <p>2 21. Given a list of statements, the student will be able to <u>recognize</u> the one which best describes the difference between air equivalent and tissue equivalent chambers.</p> <p>2 22. Given a list of statements, the student will be able to <u>recognize</u> the statement which best describes the operation difference between the ion chamber and the proportional chamber.</p> <p>2 23. Given a description of the Geiger-Mueller counter, the student will be able to <u>recall</u> the principle and steps of its operation.</p> <p>2 24. Using no references, the student will be able to <u>recall</u></p> <ul style="list-style-type: none"> a. two advantages <ul style="list-style-type: none"> (1) sensitivity (2) portable (3) generally rugged b. two disadvantages <ul style="list-style-type: none"> (1) count not proportional to absorbed dose (2) blocking of readings (3) directional sensitivity <p>of the G-M counter. The advantages/disadvantages must come from the list provided.</p> <p>2 25. Given a list of statements, the student will be able to <u>recognize</u> the one which best describes the principles of operation of the</p> <ul style="list-style-type: none"> a. scintillation detector b. photographic device c. thermoluminescent device d. photoluminescent device e. semiconductor device 	

Performance Objectives		
Lesson		Module 6 Unit 2
	Ionizing Radiation	
2	26. Given a list of statements, the student will be able to <u>recognize</u> the statement(s) that describe(s) a. advantages b. disadvantages of the use of film badges as a radiation monitoring device.	
2	27. Using no references, the student will be able to <u>recall</u> at least one difference between a pocket dosimeter and a pocket ion chamber.	
2	28. Given a description of a situation which has a potential radiation hazard, a list of the types of radiation involved, and any reference materials, the student will be able to select the appropriate monitoring device (e.g., G-M counter versus proportional counter).	
3	29. Given a list of statements, the student will be able to <u>recognize</u> the one(s) which best describe the responsibilities of the safety professional with respect to radiation protection.	
3	30. Given a list of statements, the student will be able to select the one(s) which best describe(s) the purpose of a radiation safety program.	
3	31. Given a list of statements, the student will be able to <u>recognize</u> the one which best describes the function of "distance" from the source as a protective measure against radiation exposure.	
3	32. Using no references, the student will be able to <u>recall</u> and list at least four responsibilities of the safety professional with respect to the monitoring and control of radiation.	
3	33. Given an exposure rate (rads or R) at a specified distance, the student will be able to calculate the change in exposure rate caused by a specified change in distance.	
3	34. Given a list of statements, the student will be able to select the one which best describes <u>half value layer</u> (HVL).	
3	35. Given the exposure rate, at a specified distance, of a radionuclide, the HVL of the radionuclide, and a table of HVL attenuation coefficients, the student will be able to calculate a. the attenuation caused by a certain thickness of shielding b. the shielding required for a certain attenuation or reduction in exposure rate.	
3	36. Given an exposure rate at a specified time, a half-life attenuation table, and the half-life value for the radionuclide, the student will be able to calculate the change in exposure rate due to a known elapsed time.	

Performance Objectives		
Lesson		Module 6 Unit 2
	Ionizing Radiation	
3	37. Given the activity in curies of a known gamma-emitting radionuclide, the energy in MeV, the fraction of disintegrations emitting the energy, and the distance from the source, the student will be able to calculate the absorbed dose in mR/hr.	
3	38. Given the absorbed dose (as calculated above), the student will be able to calculate the effect of modifying <ul style="list-style-type: none"> a. time of exposure b. distance from source c. shielding for gamma emitters.	
3	39. Given <ul style="list-style-type: none"> a. workload--mamp-min/week b. use factor c. occupancy factor d. tube voltage e. distance from source to personnel HVL table for X-radiation, and an Average Radiologic Output Table for X-ray machine, the student will be able to calculate the shielding necessary to meet the MPD value of 0.1 R/hr.	
3	40. Given a list of statements, the student will be able to <u>recognize</u> the one which defines <ul style="list-style-type: none"> a. range b. unit density as used in reference to beta particles.	
3	41. Given the unit density of a specified beta emitter and the density of a shielding material selected, the student will be able to calculate <ul style="list-style-type: none"> a. the attenuation of a given thickness of shielding b. the shielding required to stop all beta particles 	
3	42. Given a list of statements, the student will be able to <u>recognize</u> the one which best describes why light elements are used to shield beta emitters.	
3	43. Given a list of statements, the student will be able to <u>recognize</u> the one which best describes the danger involved with alpha emitters.	
3	44. Given the hydrogen density of a material, a table or graph of hydrogen attenuation coefficients, and the formula for calculating HVL, the student will be able to calculate the HVL value for a neutron for a specified energy level.	

Performance Objectives		
Lesson	Ionizing Radiation	Module 6 Unit 2
3	45. Given a description of a situation describing the use of a known radiation source and the protective measures taken, the student will be able to determine if the protective measures are adequate and the steps necessary to correct any deficiencies.	
3	46. Given a description of a radiation area, the student will be able to <u>recall</u> and list the procedure for making routine measurements, including the components of an operations analysis.	
3	47. Given a list of statements, the student will be able to recognize the one which best describes the procedure for <ul style="list-style-type: none"> a. smear (wipe) test for surface contamination b. air analysis c. water sample analysis 	
3	48. Given a description of a procedure involving radiation and an employee's activities when working with the radiation source, the student will be able to determine the proper location for the placement of personnel monitors.	
3	49. Given a description of a facility using radioisotopes with a potential for contamination, the student will be able to identify potential problems in the design of the facility. These problems may include: <ul style="list-style-type: none"> a. inadequate shielding b. rough, porous working surfaces c. dust collecting areas; including suspended lights and pipes, roof trusses d. nonenclosed shelving e. poor construction, causing potential leakage f. inavailability of special handling equipment g. inadequate or inappropriate heat and exhaust system design h. insufficient containment procedures; e.g., glove box 	
3	50. Given a description of a radiation area, including the level of radiation involved and any references selected by the student, the student will be able to select the appropriate radiation warning signs for that area.	
3	51. Given the amount and type of radioactivity involved, the air/water flow of the given system, and Handbook #69, the student will be able to calculate the maximum radioactive waste which can be disposed of by <ul style="list-style-type: none"> a. release into the air b. release into tidal waters or sewage system c. incineration 	

Performance Objectives		
Lesson		Module 6 Unit 2
3	52. Given the amount and type of radioactivity involved and the NRC limits for burial procedures, the student will be able to calculate what percent of the radioisotope may be disposed of by burial.	
3	53. Given no references, the student will be able to <u>recall</u> the primary differences between shielding garments and protective clothing.	
3	54. Given a list of statements, the student will be able to <u>recognize</u> the one(s) which best describe the purpose and components of <ul style="list-style-type: none"> a. pre-employment medical examinations b. periodic medical examinations c. follow-up examinations 	
3	55. Given a list of statements, the student will be able to recognize the one which best describes the procedure for decontamination of personnel and facilities.	

Unit Activities--Instructor	
Ionizing Radiation	Module 6 Unit 2
<p>In order to present the unit material to the students, the instructor is responsible for the following:</p>	
<p><u>Lesson 1--Principles of Ionizing Radiation</u></p>	
<p><u>Classroom Presentation</u></p>	
<p>Present a lecture related to the physics and chemistry of ionizing radiation. The lecture should emphasize the properties and characteristics of alpha, beta, gamma, X-, and neutron radiation. Also, the lecture is designed to present such topics as common units of radiation measure, biological effects of radiation, established exposure limits, and common applications. By the completion of this lesson, the student should have a basic understanding of the principles of ionizing radiation.</p>	
<p><u>Time Allotted</u></p>	
<p>2 Hours</p>	
<p><u>Demonstrations</u></p>	
<p>No demonstrations are required.</p>	
<p><u>Supervised Practice</u></p>	
<p>No supervised practice is required.</p>	

Unit Activities--Instructor	
Ionizing Radiation	Module 6 Unit 2
<u>Lesson 2--Monitoring Instrumentation</u>	
<u>Classroom Presentation</u>	
<p>This lesson is designed to provide an overview of the principles, operation, and use of basic ionizing radiation monitoring instrumentation. The instructor should provide each student with the opportunity to examine each piece of equipment. Time is not allotted in this lesson to allow a practical application demonstration of each instrument.</p>	
<u>Time Allotted</u>	
1 Hour	
<u>Demonstrations</u>	
<p>The instructor should briefly demonstrate the use of</p> <ol style="list-style-type: none"> 1. ionization chamber 2. proportional chamber 3. Geiger-Mueller counter 4. scintillation detectors 5. film badges 6. pocket dosimeter 7. pocket ion chamber 	
<p>The demonstration should include a brief description of the instruments, including</p> <ol style="list-style-type: none"> a. components of the instrument b. primary use c. range and type of radiation which can be monitored d. meter readings, range, unit e. adaptation required for different types of radiation f. steps for use 	
<u>Supervised Practice</u>	
<p>Time is not allotted for supervised practice, but each student should be given an opportunity to examine the equipment.</p>	

Unit Activities--Instructor

Ionizing Radiation

Module 6
Unit 2

Lesson 3--Control of Ionizing Radiation

Classroom Presentation

Present a lecture concerning the monitoring and control of ionizing radiation, including such things as shielding requirements, facilities design, and decontamination procedure.

Time Allotted

2 Hours

Demonstrations

No demonstrations are required.

Supervised Practice

No supervised practice is required.

Unit Activities--Student

Ionizing Radiation

Module 6
Unit 2

In order to complete the unit successfully, the student will be responsible for the following:

Lesson 1--Principles of Ionizing Radiation

Classroom Activity

Attend a 2-hour lecture related to the physics and chemistry of ionizing radiation. By the end of the lesson, the student should have a basic understanding of the principles of ionizing radiation.

Assignment

The student should review the following materials prior to attending class.

READING	SHORT COURSE	EXTENDED 1-HOUR
Industrial Hygiene Engineering and Control		Section 6 Chapter 3
the Industrial Environment--its Evaluation and Control		Chapter 29
PROBLEMS		
Practice Exercises		Section 6 Chapter 2

Unit Activities--Student

Ionizing Radiation

Module 6
Unit 2

In order to complete the unit successfully, the student will be responsible for the following:

Lesson 2--Monitoring Instrumentation

Classroom Activity

Attend a one-hour lecture on the principles, operation, and use of basic ionizing radiation monitoring instrumentation.

Assignment

The student should review the following materials prior to attending class.

READING	SHORT COURSE	EXTENDED 1-HOUR
Industrial Hygiene Engineering and Control		Section 6 Chapter 4
PROBLEMS		
Industrial Hygiene Engineering and Control		Section 6 Chapter 3

Unit Activities--Student		
Ionizing Radiation		Module 6 Unit 2
<p>In order to complete the unit successfully, the student will be responsible for the following:</p>		
<p><u>Lesson 3--Control of Ionizing Radiation</u></p>		
<p><u>Classroom Activity</u></p>		
<p>Attend a two-hour lecture on the monitoring and control of ionizing radiation.</p>		
<p><u>Assignment</u></p>		
<p>The student should review the following materials prior to attending class.</p>

Lesson Outline	
Principles of Ionizing Radiation	Module 6 Unit 2 Lesson 1
TOPIC	REMARKS
<p>I. Ionizing Radiation--Introduction</p> <p>A. Atomic Structure</p> <ol style="list-style-type: none"> 1. There exist over 100 elements; the basic ingredient in all materials. 2. Atom--smallest particle of an element which possesses chemical properties of that element. 3. Atom--composed of three fundamental particles. <ol style="list-style-type: none"> a. proton--positive charge (+1) and mass of 1 atomic mass unit (amu) b. neutron--no charge and mass of 1 amu c. electron--negative charge (-1); mass of 5.43×10^{-4} amu 4. Protons and neutrons contribute most of mass and make up the nucleus. 5. Electrons exist in orbits around the nucleus. 6. Undisturbed atom will have equal numbers of protons and electrons--electrically neutral. 7. Atom with surplus or deficit of orbital electrons--positively or negatively charged--called an <u>ion</u>. <p>II. Radioactivity</p> <p>A. For a given number of protons, nuclear stability exists with a certain number of neutrons.</p> <p>B. Atoms with same number of protons, but different neutrons, are called <u>isotopes</u>.</p> <p>C. Radioactivity--Improper (unstable) isotope.</p>	<p>If necessary, review with the students the differences between ionizing and nonionizing radiation. This section is provided as a review. It may be deleted at the instructor's discretion.</p> <p>Slide 6.2.1.1.--Components of an Atom</p> <p>Slide 6.2.1.2.--Nuclides of Hydrogen</p> <p>Use hydrogen as an example of</p>

Lesson Outline	
Principles of Ionizing Radiation	Module 6 Unit 2 Lesson 1
TOPIC	REMARKS
<p>D. Atoms will spontaneously transform to more stable state; radiation emitted in form of:</p> <ol style="list-style-type: none"> 1. Alpha particles 2. Beta particles 3. Gamma radiation 4. Combination of the above. <p>E. Alpha Particles</p> <ol style="list-style-type: none"> 1. Originate in the nucleus of radioactive atom. 2. Composed of 2 protons and 2 neutrons (helium nucleus). 3. Mass of 4 amu and a charge of +2. 4. When emitted, new element formed; atomic number decreases by 2 and atomic weight decreases by 4. 5. Energy of alpha dependent upon radionuclide source; may occur up to 10 MeV. 6. Cause more ionization than beta or gamma radiation, but travel much shorter distance. 7. Range. <ol style="list-style-type: none"> a. range short because of high mass and large charge b. general range of alpha particles in air is approximately 4 inches. c. can be stopped by a film of water, sheet of paper, or other paper-thin materials. 8. Sources. <ol style="list-style-type: none"> a. radioactive decay b. e.g., $^{90}\text{Th}^{232}$, $^{92}\text{U}^{238}$ 9. Interaction with target-- attract two electrons to form helium atom (direct ionization). 	Slide 6.2.1.3.--Alpha Particles
	Ask students if there is a potential hazard with alpha particles if the range is short and stopped by paper.
	Slide 6.2.1.4.--Relative Penetrating Capability of Alpha Particles
	Refer to sample decay chain presented later.
	Slide 6.2.1.5.--Interaction of Alpha Particles

Practice Exercises

Principles of Ionizing Radiation

Module 6
Unit 2
Lesson 1

1. On the graph provided, chart the radioactive decay of radioisotope $^{85}\text{Q}^{215}$ if the following types of radiation are emitted in the sequence provided. What is the atomic number and mass of the element at the end of the emissions?

1. Alpha particle
2. Negatron
3. Gamma radiation and alpha particle
4. Positron
5. Alpha particle

Practice Exercises

Principles of Ionizing Radiation

Module 6
Unit 2
Lesson 1

Practice Exercises

Principles of Ionizing Radiation

Module 6
Unit 2
Lesson 1

5. Assume that a radioactive source is emitting beta and gamma radiation and that monitoring equipment has indicated an absorbed and exposure rate of 2.5 mrad/hr and 12.0 mR/hr, respectively. How many hours per week could the employee remain working in this environment and not exceed the MPD value for whole body exposure over a period of 13 weeks?

Practice Exercises--Solutions

Principles of Ionizing Radiation

Module 6
Unit 2
Lesson 1

1. On the graph provided, chart the radioactive decay of radioisotope $^{85}\text{Q}^{215}$ if the following types of radiation are emitted in the sequence provided. What is the atomic number and mass of the element at the end of the emissions?

1. Alpha particle
2. Negatron
3. Gamma radiation and alpha particle
4. Positron
5. Alpha particle

Solution:

Practice Exercises--Solutions

Principles of Ionizing Radiation

Module 6
Unit 2
Lesson 1

2. Given that a quantity of Uranium-238 is decaying at the rate of 2.6×10^5 disintegrations per second, what amount of Uranium (in curies) would emit this activity?

Solution:

$$\frac{2.6 \times 10^5 \text{ disintegrations}}{\text{second}} \times \frac{\text{sec-curiie}}{3.7 \times 10^{10} \text{ disintegrations}} = 7.027 \times 10^{-6} \text{ Ci}$$

3. How many disintegrations per second would be expected from a Strontium-90 with an activity of 500 curies?

Solution

$$500 \text{ Ci} \times \frac{3.7 \times 10^{10} \text{ dis}}{\text{sec-Ci}} = 1.85 \times 10^{13} \text{ disintegrations/second}$$

4. A beta emitter has a monitor reading of 150 mrads/hr at 0.5 cm. Calculate the dose equivalent. How many hours per week could an employee be exposed and not exceed the MPD for hand exposure over 13 weeks?

Solution

$$\begin{aligned} \text{rem} &= \text{rad} \times \text{QF} \\ &= \frac{150 \text{ mrad}}{\text{hr}} \times 1 \\ &= \frac{150 \text{ mrems}}{\text{hr}} \end{aligned}$$

$$\text{MPD}_{\text{hand}} = 25 \text{ mrem/qrtr}$$

$$\frac{25 \text{ rems}/13 \text{ wks}}{150 \times 10^{-3} \text{ rems/hr}} = 166.7 \text{ hours}/13 \text{ weeks}$$

$$\frac{166.7 \text{ hours}}{13 \text{ weeks}} = 12.8 \text{ hours/week}$$

Practice Exercises--Solutions

Principles of Ionizing Radiation

Module 6
Unit 2
Lesson 1

5. Assume that a radioactive source is emitting beta and gamma radiation and that monitoring equipment has indicated an absorbed and exposure rate of 2.5 mrad/hr and 12.0 mR/hr, respectively. How many hours per week could the employee remain working in this environment and not exceed the MPD value for whole body exposure over a period of 13 weeks?

Solution

$$QF_{(\text{gamma})} = 1$$

$$QF_{(\text{beta})} = 1$$

$$\therefore 12 \text{ mR/hr} \cdot 1 = 12.0 \text{ mrem/hr}$$

$$2.5 \text{ mR/hr} \cdot 1 = \frac{2.5 \text{ mrem/hr}}{14.5 \text{ mrem/hr}} - \text{Total dose equivalent/hr}$$

For 13-week period

$$\text{MPD} = 3.0 \text{ for whole body exposure}$$

$$\therefore \text{Total hours} = \frac{3.0 \text{ rem/13 weeks}}{14.5 \times 10^{-3} \text{ rem/hr}} = 206.9 \text{ hrs/13 weeks}$$

$$\frac{206.9 \text{ hrs}}{13 \text{ weeks}} = 15.9 \text{ hours/week}$$

Lesson Outline	
Monitoring Instrumentation	Module 6 Unit 2 Lesson 2
TOPIC	REMARKS
<p>I. Instrumentation--Introduction</p> <p>A. Radiation detection instruments operate on monitoring the effect of ionization; e.g., ions produced in a given volume of gas can be measured.</p> <p>B. No single instrument performs acceptably under all conditions and requirements.</p> <p>C. Radiation detectors most widely used include:</p> <ol style="list-style-type: none"> 1. Ionization chamber. 2. Proportional chamber. 3. Geiger-Mueller counter. 4. Scintillation detector. 5. Photographic devices. 6. Solid state and activation devices. <p>D. Prominent personnel monitoring devices include:</p> <ol style="list-style-type: none"> 1. Film badges. 2. Pocket dosimeters. 3. Pocket ion chambers. <p>E. Protection Measurements</p> <ol style="list-style-type: none"> 1. Response of a detector due only to energy absorbed by detector itself. 2. Proper choice of detector can provide readings proportional to actual absorbed dose. 3. Generally, response of instrument is not <u>exactly</u> equivalent to the response of human tissue receiving the same energy--caused by secondary ionization factors. 4. However, may be assumed to be equal. 	

Lesson Outline	
Monitoring Instrumentation	Module 6 Unit 2 Lesson 2
TOPIC	REMARKS
<p>F. Accuracy</p> <ol style="list-style-type: none"> 1. Absorbed dose can rarely be determined directly; estimations must be acceptable. 2. MPD values conservative; can tolerate an accuracy of $\pm 15\%$. 3. Accuracy of X- and gamma readings usually better than neutrons and particulate radiation. 4. Major efforts to increase accuracy should only be of concern if readings approximate MPD; e.g., care afforded exposed individual dependent upon dose received. 	
<p>II. Instrumentation</p> <p>A. Ionization Chamber Instruments</p> <p>1. Principle</p> <ol style="list-style-type: none"> a. ionizing radiation falls on chamber b. ions are formed in chamber from radiation c. primary ions are collected at the cathode and anode d. potential voltage difference is measured e. potential difference is proportional to quantity of ionizing radiation <p>2. Uses.</p> <ol style="list-style-type: none"> a. measures relatively high level of radiation b. can measure both particulate and electromagnetic radiation c. responds to any ionization produced--difficult to discriminate between radiation types and specifically between particles of different LET 	<p>Slide 6.2.2.1.--Ionization Chamber</p> <p>Demonstrate the ionization chamber instrument to the students. Be sure to discuss:</p> <ol style="list-style-type: none"> A. Components of the instrument. B. Primary use. C. Range and type of radiation which can be measured. D. Meter readings; range, units. E. Adaptation required for different types of radiation. F. Steps for use.

Lesson Outline	
Monitoring Instrumentation	Module 6 Unit 2 Lesson 2
TOPIC	REMARKS
<p>3. Ionization chamber.</p> <ul style="list-style-type: none"> a. usually 190-320 cm³ in volume b. the larger the chamber, the greater the sensitivity and required operational voltage c. can be modified to measure all types of radiation d. usually open to atmosphere and requires corrections for ambient temperature and pressure e. sealed chambers may change because of leakage or absorption and adsorption on inside surface f. wall of chamber of critical importance-- affects reading; thickness must approximate maximum range of ionized particles produced g. chamber can be <ul style="list-style-type: none"> (1) air equivalent-- measures exposure (2) tissue equivalent-- simulates human tissue and is calibrated to measure absorbed dose. <p>4. Advantages.</p> <ul style="list-style-type: none"> a. simple, rugged device b. reliably determines absorbed dose or exposure <p>5. Disadvantages.</p> <ul style="list-style-type: none"> a. special design required to discriminate <u>well</u> between types of radiation b. must have general knowledge of radiation spectrum of interest 	<p>Slide 6.2.2.2.--Ionization Chamber Wall Thickness</p> <p>Present information about wall thickness only to emphasize criticality of wall thickness.</p> <p>Briefly describe the two types of chambers and advantages of each.</p>

<p>II. Authorization for Radionuclide Use</p> <p>A. Generally, use of radionuclides and radiation-producing instruments licensed.</p> <p>1. Federal--Nuclear Regulatory Commission</p> <p>2. State--Health Department; e.g., X-ray machine</p>	Slide 6.2.3.6.--NRC Established MPC Value Point out level of radionuclides required to necessitate licensing; e.g., small sealed sources do not require licensing.

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>B. License issued after applicant defines</p> <ol style="list-style-type: none"> 1. Type of radionuclide. 2. Potential use. 3. Maximum quantities involved. 4. Training and experience of users. 5. Monitoring procedures to be used. 6. Laboratory facilities. 7. Handling equipment. 8. Disposal procedure. 9. Radiation protection program. <p>C. For specific procedures, contact NRC or State Health Department</p> <p>III. Protection of Radiation Hazard</p> <p>A. Goal</p> <ol style="list-style-type: none"> 1. Prevent overexposure from external radiation. 2. Minimize entry of radio-nuclides into the body (internal radiation). <p>B. Three basic tools which can provide protection.</p> <ol style="list-style-type: none"> 1. Time. 2. Distance 3. Shielding. <p>C. Time</p> <ol style="list-style-type: none"> 1. This element of protection is self-explanatory. 2. Radiation occurs at a rate of roentgens (or rads) per hour. 3. The shorter the time of exposure, the smaller the radiation dose received. 4. Work procedures should be reviewed carefully to minimize time. 	
	Inform students survey procedure will be discussed following the section on protection.
	Slide 6.2.3.7.--Time versus Radiation Exposure

Lesson Outline		
Control of Ionizing Radiation		Module 6 Unit 2 Lesson 3
TOPIC	REMARKS	
<p>5. Second factor with respect to time is half-life. If exposure potential high, may wish to wait for radioactive decay to occur.</p> <p>a. loss of strength can be calculated if original activity and date of measure are known.</p> <p>b. decrease of activity of source is equal to $(1/2)^n$ where n = number of half-lives which have passed since last known measurement.</p>	Concept of half-life previously discussed.	
<p><u>Example</u></p> <p>An isotope acquired from a national laboratory in June 1977 a surplus Co-60 source which had an exposure rate of 40 mR/hr at 10 cm in January of 1970.</p> <p>What is the exposure rate the user could expect in June 1977?</p>	Slide 6.2.3.8.--Example--Calculation of Half-Life Effect	
<p><u>Solution</u></p> <p>June 1977 to January 1970 = 7.5 years</p> <p>Half-life of Co-60 = 5.3 years</p> <p>Half-life = $\frac{7.5}{5.3} = 1.415$</p> <p>Using $(1/2)^n$</p> <p>$1.415 \text{ half-lives} = (1/2)^{1.415} = 0.375$</p> <p>Exposure rate (June 1977) =</p> <p>$40 \text{ mR/hr} \cdot 0.375 = 15 \text{ mR/hr}$</p> <p>D. Distance</p> <ol style="list-style-type: none"> 1. Second tool of protection. 2. Radiation source is reduced by a factor of 1 divided by the square of the distance between the worker and the source--"inverse square law." 	Slide 6.2.3.9.--Solution--Calculation of Half-Life Effect	
	<p>Note: Inform students that tables exist which calculate $(1/2)^n$ for values of n; such a table is found in the student's textbook.</p> <p>Slide 6.2.3.10.--Distance Versus Radiation Exposure</p>	

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>3. e.g., know that radiation level is 1.0 R/hr at one ft. If the worker is moved to distance of 5 ft., exposure would now be</p> $(5)^{\frac{1}{2}} \cdot 1.0 \text{ R/hr or } 0.04 \text{ R/hr}$ <p><u>Solution</u></p> <p>Radiation level 1.0 R/hr at 1 ft.</p> <p>R = ? at 5 ft.</p> $\frac{1.0 \text{ R/hr}}{(5)^2} = 0.04 \text{ R/hr at 5 ft}$ <p>4. Important that the distance of measurement and the units of "inverse square law" are equivalent; i.e., if exposure level determined at X feet, distance must also be in feet.</p> <p>E. Shielding</p> <ol style="list-style-type: none"> 1. Attained by placing radiation absorbing barrier between source and employee to be protected. 2. Selection of shielding dependent upon type and amount of radiation source radionuclides. 3. Location and shape of shield. <ul style="list-style-type: none"> a. must limit radiation in all directions which provide potential exposure to employees b. thickness of shielding required is relatively independent of distance from source or object c. to minimize size of shield, maximize protection, shield should be as close to source as possible. 	Place example on chalkboard.

Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<u>Solution</u> From table Range in unit density P-32 = 0.8 cm Maximum range in glass $\frac{0.8 \text{ cm-gm}}{\text{cm}^3} \times \frac{\text{cm}^3}{2.3\text{gm}} = 0.35 \text{ cm}$ glass <p>7. Important consideration-- shielding materials must be light (small atomic weight); e.g., Al, H₂O, glass.</p> <p>a. beta converts to X-radiation which is more penetrating</p> <p>b. more likely with heavier compounds (Pb, iron)</p> <p>J. Alpha Particles</p> <ol style="list-style-type: none"> Alpha particles have limited range. Alpha radiation cannot penetrate the layer of dead skin. Danger--alpha emitter entering body--containment required; e.g., glove box, respirator. <p>K. Neutron Shielding</p> <ol style="list-style-type: none"> Concepts of HVL and attenuation of coefficients described with gamma photons also apply to neutrons. Most absorption materials for neutrons are high in hydrogen content (>20%). Attenuation of hydrogen per energy level is prescribed in graph. Attenuation for other medium. <ol style="list-style-type: none"> calculate hydrogen density in that medium multiply by attenuation coefficient 	Slide 6.2.3.34.--Solution-- Shielding Requirements-- Beta Slide 6.2.3.35.--Glove Box Slide 6.2.3.36.--Attenuation Coefficient of Hydrogen

Lesson Outline		
Control of Ionizing Radiation		Module 6 Unit 2 Lesson 3
TOPIC	REMARKS	
<p>5. Calculate HVL by</p> $HVL = 0.693/\text{attenuation coefficient}$ <p><u>Example</u></p> <p>Calculate the attenuation due to hydrogen in a water shield 1.5 cm thick, 8 MeV neutrons.</p> <p><u>Solution</u></p> <p>Water is 11% H_2 by weight</p> $\therefore \text{density } (H_2) = 0.11 \text{ g/cm}^3$ <p>From figure</p> <p>For MeV = 8.0, attenuation coefficient = $0.68 \text{ cm}^{-1}/\lg H_2/\text{cm}$</p> <p>For water</p> $\begin{aligned} \text{attenuation coefficient} &= 0.68 \times 0.11 \\ &= 0.075 \text{ cm}^{-1} \end{aligned}$ $HVL = \frac{0.693}{0.075} = 9.24 \text{ cm}$ $\text{Number of HVL} = \frac{150}{9.24} = 16.2$ $\begin{aligned} \text{Attenuation} &= (1/2)^n = (1/2)^{16.2} \\ &= 1.3 \times 10^{-5} \end{aligned}$ <p>6. Can be used to calculate effect of shielding.</p> <p>7. Neutron activity usually leads to emission of gamma radiation; therefore, neutron shielding requires gamma shielding. Problem beyond the scope of this text.</p> <p>L. Summary--Shielding</p> <p>1. Discussed shielding for</p> <ol style="list-style-type: none"> gamma X-ray beta alpha neutron 	Slide 6.2.3.37.--Example-- Attenuation Neutron Shielding	Slide 6.2.3.38.--Solution-- Attenuation Neutron Shielding

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>2. Generally, all shielding serves some purpose; absorb radiation.</p> <p>3. Design of shield depends upon attenuation and requirements.</p> <p>4. Design of shield is more sophisticated than presented but general overview provided. Ask for questions.</p> <p>IV. Survey and Monitoring Procedures for Radiation Hazards</p> <p>A. Purpose</p> <p>1. Indicate general level of radiation in working environment.</p> <p>2. Monitor changing levels of radiation.</p> <p>B. Area Survey Includes</p> <p>1. Initial examination of facility.</p> <p>2. Laboratory operating procedures.</p> <p>3. Personnel habits.</p> <p>4. Types of sources.</p> <p>5. Methods used in handling sources.</p> <p>6. Radiation levels.</p> <p>C. Routine Surveys Should Be Scheduled</p> <p>1. To detect inadequate shielding; e.g., cracks.</p> <p>2. Excessive surface and airborne contamination.</p> <p>3. Improper disposal of waste.</p> <p>4. Emphasis placed on unlikely and remote areas.</p> <p>D. Routine measurements should be made at intervals during conduct of work for all steps and procedures, including</p> <p>1. Time of procedure and exposure</p> <p>2. Distance from source.</p>	Slide 6.2.3.39.--Survey and Monitoring Procedures
	Give examples of how exposure level, distance from source, and time of exposure may vary for a given individual.

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>3. Variations in exposure throughout procedure.</p> <p>4. Specific areas of the body receiving more exposure.</p> <p>E. Surface Contamination</p> <ol style="list-style-type: none"> 1. Evaluated by smear (wipe) test. 2. Determines amount of loose material may become airborne or transferred to personnel. 3. Specific surface area (100 cm²) wiped off with clean cloth, paper, or tape. 4. Smear samples removed to low background area and reading taken. 5. If area size (100 cm²) kept constant and equipment properly calibrated, readings can be quantified. 6. Corrective action taken as necessary. <p>F. Air Monitoring</p> <ol style="list-style-type: none"> 1. Sample may be collected by standard procedure using filters, electrostatic precipitators, and impingers. 2. Care must be taken to insure appropriate particles of all sizes are collected. 3. Sample of 10 m³ is usually adequate; grab sample may be performed if necessary. 4. Direct counting from surfaces where sample collected appropriate. 5. When counting alpha particles, correction factors must be determined for absorption of alpha by sample collecting filter. 	Slide 6.2.3.40.--Surface Contamination
	Slide 6.2.3.41.--Air Monitoring

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>6. In some instances, naturally occurring radon and thoron may interfere with readings; when counting alpha, adjustment must be made.</p> <p>7. Values calculated to $\mu\text{Ci}/\text{cc}$ and compared with MPC for unrestricted areas.</p> <p>8. If concentration known, quantity of nuclide taken in by personnel can be calculated by determining exposure time and determining the product of the exposure time, concentration, and $10^7 \text{ cc}/8 \text{ hrs}$.</p> <p>9. If nuclide source not known, arbitrary limit.</p> <p>a. $10^{-9} \mu\text{C}/\text{cc}$--beta</p> <p>b. $10^{-12} \mu\text{C}/\text{cc}$--alpha</p> <p>10. In any instance where air contamination is possible, respirators should be used until radiation level determined.</p>	
G. Water Sample Analysis	Slide 6.2.3.42.--Water Sample Analysis
<p>1. Sampled similar to air analysis.</p> <p>2. Sample required--100-500 mL.</p> <p>3. Sample evaporated and reading taken.</p> <p>4. Results compared to MPC values.</p> <p>5. If nuclide not known, qualitative tests can determine source.</p>	
H. Personnel Monitoring	Slide 6.2.3.43.--Personnel Monitoring
<p>1. Most direct method of calculating personnel exposure.</p> <p>2. Common equipment.</p> <p>a. film badge</p> <p>b. pocket chambers</p> <p>c. pocket dosimeter</p>	Previously discussed.

Lesson Outline		
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3	
TOPIC	REMARKS	
<p>3. Personnel monitor should be matched to type and energy level of radiation.</p> <p>4. Should be used when 25% of MPD for 13-week period may be exceeded.</p> <p>5. More than one should be used at any given time to insure adequate.</p> <p>6. Location of personnel monitor critical; should be unshielded (e.g., clothing) at a point of maximum exposure.</p> <p>7. Records should be maintained concerning cumulative doses received.</p> <p>I. Fixed Monitors</p> <p>1. Sometimes used to give <u>continuous recording</u> of dose rate at fixed location.</p> <p>2. Visible or audible alarms warn of high radiation level.</p> <p>3. e.g.,</p> <p>a. doorway--if clothing contamination possible</p> <p>b. monitor hands and shoes on change of shift</p> <p>c. radiographic area</p> <p>J. Control Design</p> <p>1. Warning systems for high exposure levels.</p> <p>2. Interlock systems which minimize exposure.</p> <p>V. Facilities</p> <p>A. Purpose--Provide adequate containment and allow for ease of cleanup.</p>	Slide 6.2.3.44.--Fixed Monitors	
	Slide 6.2.3.45.--Facilities Design	

Lesson Outline	
TOPIC	REMARKS
<p>Control of Ionizing Radiation</p> <p>B. Design</p> <ol style="list-style-type: none"> 1. All surfaces should be smooth and nonporous; e.g., shelves, floors, sinks. <ol style="list-style-type: none"> a. unacceptable--uncoated wood, concrete, soapstone b. acceptable--tiles, polished stainless steel, plate glass c. ordinary paints, varnishes, and lacquers are not recommended. 2. Dust-collecting surfaces should be eliminated. <ol style="list-style-type: none"> a. lights recessed b. pipes enclosed c. shelves covered by doors d. cove corners between wall and floor facilitate cleanup e. ceilings enclosed to prevent contamination of roof trusses 3. Special piping and drainage systems should be plainly labeled if used for radioactive waste. 4. Design of room and shielding should prevent radiation leakage; e.g., <ol style="list-style-type: none"> a. construction of joints b. control for doors, pipes, conduits c. doorway maze 5. Special equipment often required. <ol style="list-style-type: none"> a. e.g., long-handled tools; tongs, forceps b. remote control devices, lead glass windows 	<p>Module 6 Unit 2 Lesson 3</p> <p>Slide 6.2.3.46.--Room Construction</p> <p>Slide 6.2.3.47.--Maze</p> <p>Describe purpose of maze.</p> <p>Previously displayed. (Slide 6.2.3.14.)</p>

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>C. Special Consideration--Design</p> <p>1. Hood.</p> <ul style="list-style-type: none"> a. need to minimize airborne contamination from unsealed source b. airflow should be a minimum of 100 linear feet per minute; if highly toxic, 125-150 fpm is required c. hood should have own exhaust system d. air contamination should be monitored e. airflow monitored for cross drafts and leaks in system f. exhaust system--development of exhaust system previously discussed in Ventilation; same principles apply <p>2. Glove boxes.</p> <ul style="list-style-type: none"> a. offer sufficient protection for alpha and soft beta rays (e.g., H^3-C^{14}) b. prevent air contamination c. hermetically sealed ports into box for gloves d. air locks allow for inserting and removing samples e. for high energy beta and gamma, gloves replaced with remote mechanical manipulator f. frequently have exhaust ports and filters-- exhaust volume usually 20-30 ft³/min g. exhaust and inlet ports should be positioned so explosion will not direct at personnel and through ports 	<p>Slide 6.2.3.48.--Ventilation Hood</p> <p>Actual calculation will be discussed later.</p> <p>Slide 6.2.3.49.--Glove Box</p>

Lesson Outline		Module 6 Unit 2 Lesson 3
TOPIC	REMARKS	
Control of Ionizing Radiation		
D. Posting the Area		
1. Areas of radioactivity should be posted if radioactivity present for longer than 8 hrs.		
2. Sign should bear--	Slide 6.2.3.50.--Radioactive Warning Sign--Symbol	
a. three-bladed radioactive caution symbol (magenta or purple on a yellow background)		
b. statement based upon level of radioactivity		
3. Signs.		
a. CAUTION RADIATION AREA-- potential dose of 5 mrem/hr or 100 mrem/week	Slide 6.2.3.51.--Radiation Warning Sign	
b. CAUTION RADIOACTIVE MATERIALS--for levels exceeding those described on slide	Slide 6.2.3.52.--Radiation Warning Sign	
(1) in room--sign	Slide 6.2.3.53.--MPC Values for Radiation Warning Sign	
(2) on container--label		
c. AIRBORNE RADIOACTIVITY AREA--if airborne contaminants may exceed MPC for 40 hours	Slide 6.2.3.54.--Radiation Warning Sign	
d. HIGH RADIATION AREA-- if dose potential greater than 100 rem/hr	Slide 6.2.3.55.--Radiation Warning Sign	
4. Post operating and handling instructions.	Slide 6.2.3.56.--Recommended Handling Procedures	
E. Trays and Handling Tools		
1. Work that may result in contamination of table top should be performed in box.		
2. Tweezers and tongs should be used whenever possible to minimize exposure.		

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
VI. Storage and Disposal of Radionuclides <ul style="list-style-type: none"> A. Storage <ul style="list-style-type: none"> 1. Should be stored in designated areas--protect against fire, explosion, or flooding. 2. Should be in suitable containers, adequately shielded. 3. Radiation level should not exceed 5 mrem/hr at 1 ft in storage areas. B. Limited amounts of waste may be disposed of by <ul style="list-style-type: none"> 1. Release into atmosphere. 2. Tidal waters, sewers. 3. Burial. C. Special waste problems can be handled by commercially licensed firm. D. Release in Air <ul style="list-style-type: none"> 1. Limited by NRC. 2. Rule of thumb--concentration should not exceed MPC at point of discharge. 3. MPC used--Handbook #69. 4. Can calculate released radionuclides, including different nuclides at once. 	Slide 6.2.3.57.--Storage and Disposal of Radionuclides
<u>Example</u> <p>A radiochemist released 0.1 Ci of tritium through hood while performing a synthesis. Airflow rate was 100 ft/min with a 1 ft x 4.5 ft hood opening.</p> <p>Was MPC exceeded if averaged over 1 week?</p>	Slide 6.2.3.58.--Example--Calculation of Air Contamination

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<u>Solution</u> <p>Flow rate for hood calculated to be</p> $\frac{100 \text{ ft}}{\text{min}} \times 1 \text{ ft} \times 4.5 \text{ ft} \times \frac{28,317 \text{ cc}^3}{\text{ft}^3} \times \frac{480 \text{ min}}{8 \text{ hr day}} \times \frac{5.0 \text{ days}}{\text{week}} = \frac{3.06 \times 10^{10} \text{ cc}}{\text{week}}$ <p>From table (Handbook #69) MPC (${}^3\text{H} = 2.0 \times 10^{-13} \text{ Ci/cc/wk}$)</p> <p>Therefore, maximum release</p> $\frac{2.0 \times 10^{-13} \text{ Ci}}{\text{cc/wk}} \times 3.06 \times 10^{10} \text{ cc} = \frac{0.006 \text{ Ci}}{\text{wk}}$ <p>. . . MCP exceeded</p> <p>E. Liquid Disposal</p> <ol style="list-style-type: none"> 1. Liquid radioactive wastes can be deposited in unrestricted water or sewer system. 2. Levels established by NRC must be met. <ol style="list-style-type: none"> a. unrestricted--public drinking water b. restricted--sewerage system 3. Both daily and monthly MPC levels must be met by radionuclide. 4. Disposal may not exceed 1.0 Ci per year total. 	Slide 6.2.3.59.--Solution--Calculation of Air Contamination Assume hood operates 8 hr/day, 5 days a week
	Slide 6.2.3.60.--NRC Established MPC Levels
<u>Example</u> <p>Determine how much I-125 and P-32 can be dumped into the sewer if water flow to the sewerage (based on water bills) is $1.2 \times 10^7 \text{ ft}^3/\text{yr}$.</p>	Slide 6.2.3.61.--Example--Water Contamination

Lesson Outline	
TOPIC	REMARKS
<p><u>Solution</u></p> <p>From table</p> $\text{MPC I-125} = 4.0 \times 10^{-12} \text{ Ci/cc}$ $\text{MPC P-32} = 5.0 \times 10^{-10} \text{ Ci/cc}$ <p>Average daily water flow</p> $\frac{1.2 \times 10^7 \text{ ft}^3}{\text{yr}} \times \frac{\text{year}}{365 \text{ days}} \times \frac{2.8317 \times 10^4 \text{ cc}}{\text{ft}^3} = 9.31 \times 10^8 \text{ cc/day}$ <p>Daily Limits</p> <p>I-125</p> $\frac{4.0 \times 10^{-11} \text{ Ci}}{\text{cc}} \times \frac{9.31 \times 10^8 \text{ cc}}{\text{day}} = \frac{37.24 \text{ mCi}}{\text{day}}$ <p>P-32</p> $\frac{5.0 \times 10^{-10} \text{ Ci}}{\text{cc}} \times \frac{9.31 \times 10^8 \text{ cc}}{\text{day}} = \frac{0.466 \text{ Ci}}{\text{day}}$ <p>A maximum of 1 Ci per year for disposal of gross activity is set. Therefore, the number of daily disposals is limited.</p> <p>F. Solid Wastes</p> <ol style="list-style-type: none"> 1. Three methods for disposal. <ol style="list-style-type: none"> a. incineration b. burial c. commercial company 2. Incineration. <ol style="list-style-type: none"> a. good bulk-reducing method b. again, regulated by NRC c. rule of thumb--concentration released to unrestricted areas should not exceed limits specified for continuous exposure 	<p>Module 6 Unit 2 Lesson 3</p> <p>Slide 6.2.3.62.--Solution--Water Contamination</p>

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>d. when calculating release, concentration may be averaged over a maximum of one year</p> <p>e. ash left after incineration must also be treated as radioactive waste</p> <p>f. calculation of limits for released radioactivity identical to calculating release of air as previously described; must know</p> <p>(1) radionuclide(s) (2) airflow</p> <p>3. Burial.</p> <p>a. NRC rules fairly simple</p> <p>(1) allowed 12 burials per year</p> <p>(2) must be at <u>least</u> 6 ft apart and 4 ft deep</p> <p>(3) total quantity buried at any location may not exceed 1000 times figures on chart (Table 5.1 textbook)</p> <p>(4) if several nuclides buried, the sum of nuclide fractions cannot exceed one (1)</p> <p>b. state regulations may vary--be sure to check</p>	Slide 6.2.3.63.--Example--Burial Procedure
<u>Example</u> A user of radionuclides plans to dispose of 2 mCi of Fe-59, 10 mCi of Cr-51, and 20 mCi of I-125 by burial.	

Lesson Outline	
TOPIC	REMARKS
<p><u>Solution</u></p> <p>From table</p> <p>Can bury 1000 times value</p> <p>Fe-59 = 10 mCi Cr-51 = 100 mCi I-125 = 1 mCi</p> <p>Would use of 1.0 Ci allowed</p> <p>Fe-59 = $\frac{2}{10} = 0.20$</p> <p>Cr-51 = $\frac{10}{1000} = 0.01$</p> <p>Could bury $0.79 \times 1 \text{ mCi}$ I-125 or 0.79 mCi</p> <p>Therefore, I-125 could not be disposed of by burial with the other nuclides or by itself.</p> <p>VII. Personnel</p> <ul style="list-style-type: none"> A. Maximum exposure limits established. B. Personnel have responsibilities to minimize exposure. C. Training. <ul style="list-style-type: none"> 1. NRC has established training requirements for operators. 2. Each person potentially exposed to radioactivity should receive training in <ul style="list-style-type: none"> a. potential danger b. operational procedures which minimize exposure c. procedures in case of accidents D. Personal Protective Clothing <ul style="list-style-type: none"> 1. Special clothing which can be easily laundered or disposed of should be worn if contamination possible. 	<p>Module 6 Unit 2 Lesson 3</p> <p>Slide 6.2.3.64.--Solution--Burial Procedure</p> <p>Slide 6.2.3.65.--Responsibilities of Personnel</p>

Lesson Outline

TOPIC	REMARKS
<p>2. Degree of protection required is a function of</p> <ul style="list-style-type: none"> a. quantity and type of radioactivity b. nature of operation c. design of laboratory <p>3. Sealed containers do not usually require protective clothing.</p> <p>4. Garments.</p> <ul style="list-style-type: none"> a. in general, protective clothing not required if MPD for most critical organ (Handbook #69) not exceeded b. serves to prevent contamination outside laboratory facility c. low level work--requires <ul style="list-style-type: none"> (1) laboratory coats or coveralls (2) simple cloth or plastic bags on shoes (3) rubber or plastic gloves d. medium level work--requires <ul style="list-style-type: none"> (1) coveralls (2) caps (3) gloves (4) shoe covers e. high level work--requires <ul style="list-style-type: none"> (1) multi-layer of coveralls, shoes, etc.; clothes should be sealed (2) self-contained breathing apparatus should be used (3) should not be encountered during normal operation 	

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>5. Respiratory protection.</p> <ul style="list-style-type: none"> a. required when concentration in air exceeds MPD values b. respirators vary <ul style="list-style-type: none"> (1) simple respirators filter particles (2) self-contained breathing apparatus c. limits of respiratory equipment <ul style="list-style-type: none"> (1) fit of mask (2) always 1-2% leakage (3) growth of beard may affect mask fit <p>6. Shielding garments.</p> <ul style="list-style-type: none"> a. used for close contact work with radiation of low penetrating power b. leather and rubber effective against most beta c. fabrics loaded with high atomic material (Pb) used for shielding X-radiation d. should <u>not</u> be used for high level beta and gamma radiation <p>E. Personal Hygiene</p> <ul style="list-style-type: none"> 1. Procedures minimize exposure. 2. Eating, smoking, storage of food and pipetting by mouth prohibited in radioactive areas. 3. Work with unsealed sources requires "wash up" before eating, smoking, or leaving work area. 4. Written procedures should include hygiene practices. 	Slide 6.2.3.66.--Typical Respirator
	Slide 6.2.3.67.--Lead Gloves

Lesson Outline	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>F. Personnel Monitoring</p> <ol style="list-style-type: none"> 1. Discussed previously. 2. As review, any personnel who potentially may be in an area of 25% of MPD should carry personal monitoring device; e.g., film badge, dosimeter. <p>G. Medical Supervision</p> <ol style="list-style-type: none"> 1. Because of physical hazards, medical supervision essential. 2. Pre-employment examination. <ul style="list-style-type: none"> a. identify general physical condition b. quantity, if possible, of previous radiation exposures c. identify potential problems that may be magnified or potentially dangerous to employee in radioactive environment; e.g., <ul style="list-style-type: none"> (1) dermatological diseases (2) impairment of pulmonary ventilation (3) cataracts d. decision of employment and placement should consider these factors 3. Periodic medical examination. <ul style="list-style-type: none"> a. performed at appropriate intervals based upon <ul style="list-style-type: none"> (1) general health of employee (2) nature of work b. provide insight of any medical changes c. should not be used as reliable method for monitoring radiation hazard 	<p>Slide 6.2.3.68.--Medical Supervision</p>

Lesson Outline	
Principles of Ionizing Radiation	Module 6 Unit 2 Lesson 3
TOPIC	REMARKS
<p>d. examination should include review of occupational hazard records and assessment of exposure doses</p> <p>e. medical advice should be followed with respect to continued radiation exposure</p> <p>4. Follow-up examination.</p> <p>a. desirable to have post-employment examination</p> <p>b. especially important if MPD exceeded</p> <p>c. provides</p> <p>(1) extended coverage for worker</p> <p>(2) adds to information on effects of radiation</p> <p>5. Medical records.</p> <p>a. should include medical and radiation exposure history</p> <p>b. job assignments and hazards involved should be recorded</p> <p>c. records of personal dose and accumulative exposure</p>	
VIII. Radiation Accidents	Slide 6.2.3.69.--Radiation Accidents
<p>A. Maximum effort should be made to minimize accidents; e.g.,</p> <p>1. Review operational procedures.</p> <p>2. Check equipment.</p> <p>3. For nonroutine or high-level operations, trial run should be performed.</p> <p>a. evaluate adequacy of procedure</p> <p>b. determine exposure time</p>	

Lesson Outline		
Control of Ionizing Radiation		Module 6 Unit 2 Lesson 3
TOPIC	REMARKS	
<p>B. Contamination Control</p> <ol style="list-style-type: none"> 1. In event of accident, loose contamination should be minimized. 2. All spills cleaned up promptly. 3. Cleaning tools should not be removed from area without decontamination. 4. Level of contamination difficult to determine; therefore, minimize contamination. <p>C. Monitoring for Contamination</p> <ol style="list-style-type: none"> 1. Beta-gamma--G-M counter. 2. Alpha--proportional counter. 3. "Wipe" test often performed when contamination suspected. <p>D. Personnel Contamination and Decontamination</p> <ol style="list-style-type: none"> 1. When employee's hands, body surface, clothing, shoes contaminated, loose contamination should be removed. 2. Care must be taken to minimize spreading of contamination. 3. Washing with mild soap or detergent good initial step. 4. May wish to follow up with: <ul style="list-style-type: none"> a. mild abrasive soap b. complexing solution c. mild organic acid 5. When hands involved, clipping fingernails may reduce contamination. 6. In any instance, medical personnel should be notified and the employee examined. 7. Because of potential medical treatment, a relatively accurate determination of the level of exposure is appropriate. 	<p>This is a review for students.</p>	
		Inform the students that a more detailed presentation on decontamination may be found in the textbook.

Unit 2
Lesson 3

1. Because of an accident, the shielding around a 500 mCi Co-60 source has been destroyed. What is the minimum distance to the source a person can approach if a 2.5 mR/hr level is not exceeded?
2. Determine the thickness of concrete required to reduce the intensity of a Co-60 (gamma radiation) to 1/100 its value when unshielded. (Note: HVL Co-60 = 6.6 cm concrete.) Use HVL method.
3. Determine the thickness of lead (Pb) required to reduce the dose rate from a 30 mCi Cs-137 source to 5 mrem/hr at 30 cm from the source. Use formula $I = BI_0 e^{-ux}$.
4. A technician in a pharmaceutical company routinely handles
 1. 500 mCi of I-131
 2. 100 mCi of Au-198
 3. 25 mCi of K-42all stored together in a hood. When he works in front of the hood, his mean body position is 60 cm from the active materials.
 - a. How long can the technician work in front of the hood per week without additional shielding?
 - b. What would be the effect on permissible working time if the technician used tongs, extending the mean body distance to 150 cm?

Practice Exercises	
Control of Ionizing Radiation	Module 6 Unit 2 Lesson 3
<p>5. An investigator is interested in releasing 200 mCi of Xe-133 through a hood. The air velocity into the hood is 150 ft/min through an opening 15 in high and 3 ft wide. Determine the permissible release rate so that the concentration in the effluent from the hood stack does not exceed maximum allowable concentrations averaged over a 24-hour period.</p> <p>6. In a new process being introduced in your plant, an I-131 (gamma source) with an activity of 300 mCi will be used. In the process, the personnel will be a mean distance of 70 cm from the source and be exposed to the source for an average of 15 minutes per day. Because of the new process, it is possible that some of the material (I-131) may become airborne as particulate matter.</p> <p><u>Calculate</u></p> <p>a. Potential exposure of unshielded source. b. Lead shielding required to reduce exposure to below MPD level.</p> <p>7. Prepare a list of activities which should be performed to evaluate and control the radiation hazard being introduced.</p>	

Practice Exercises--Solutions

Control of Ionizing Radiation

Module 6
Unit 2
Lesson 3

- Because of an accident, the shielding around a 500 mCi Co-60 source has been destroyed. What is the minimum distance to the source a person can approach if a 2.5 mR/hr level is not exceeded?

Solution

First, calculate the exposure rate at 1 foot

$$\text{mR/hr} = \frac{6 \cdot C \cdot E \cdot f}{d^2}$$

$$\begin{aligned} \text{mR/hr} &= 6 \cdot C \cdot E \cdot f \text{ at 1 foot} \\ &= 6 \cdot 500 \cdot 2.50 \cdot 1 \\ &= \frac{7500 \text{ mR/hr}}{1 \text{ hr}} \end{aligned}$$

Find 2.5 mR/hr

$$\begin{aligned} \text{ft}^2 &= \frac{7500}{2.5} \\ \text{ft} &= \left(\frac{7500}{2.5} \right)^{\frac{1}{2}} \\ &= 54.7 \text{ ft} \approx \underline{55 \text{ feet}} \end{aligned}$$

People should not be closer than 55 feet.

- Determine the thickness of concrete required to reduce the intensity of a Co-60 (gamma radiation) to 1/100 its value when unshielded. (Note: HVL Co-60 = 6.6 cm concrete.) Use HVL method.

Solution

Using attenuation table,

reduction by 0.01 requires 6.6 HVL

$$\therefore 6.6 \text{ HVL} \times \frac{6.6 \text{ cm}}{\text{HVL}} = 43.56 \text{ cm concrete}$$

- Determine the thickness of lead (Pb) required to reduce the dose rate from 30 mCi Cs-137 to 5 mrem/hr at 30 cm from the source.

Solution

Unshielded

$$I_0 \text{ mR/hr} = \frac{500 \text{ CEF}}{d^2}$$

$$\begin{aligned} C &= 30 \\ E &= 0.662 \\ f &= 0.85 \\ d &= 30 \end{aligned}$$

(Solution Continued)

Practice Exercises--Solutions

Control of Ionizing Radiation

Module 6
Unit 2
Lesson 3

3. (Continued)

$$I_0 = 93.78 \text{ mrem/hr}$$

$$I = 5 \text{ mrem/hr}$$

$$x = \frac{-\ln(I/I_0)}{\mu}$$

Using table for mass attenuation coefficient, calculate μ .

$$\frac{0.132 \text{ cm}^2}{\text{g}} \times \frac{11.34 \text{ g}}{\text{cm}^3} = 1.50 \text{ cm}^{-1} \quad \text{Note: } \rho_{\text{Pb}} = \frac{11.34 \text{ g}}{\text{cm}^3}$$

Initially

$$\begin{aligned} x &= \frac{-\ln(I/I_0)}{\mu} \\ &= \frac{-\ln(5/93.78)}{1.50} \\ &= 1.95 \text{ cm Pb} \end{aligned}$$

Using tables, calculate build-up factors.

$$\mu = 2.925$$

$$\text{Pb} = 0.662 \text{ MeV}$$

$$\therefore B = 1.67$$

Finally,

$$\begin{aligned} I &= BI_0 e^{-\mu x} \\ x &= \frac{-\ln(I/BI_0)}{\mu} \\ x &= \frac{-\ln(5/98.73 \cdot 1.67)}{1.50} \\ x &= 2.4 \text{ cm Pb} \end{aligned}$$

Practice Exercises--Solutions

Control of Ionizing Radiation

Module 6
Unit 2
Lesson 3

4. A technician in a pharmaceutical company routinely handles

1. 500 mCi of I-131
2. 100 mCi of Au-198
3. 25 mCi of K-42

all stored together in a hood. When he works in front of the hood, his mean body position is 60 cm from the active materials.

- a. How long can the technician work in front of the hood per week without additional shielding?
- b. What would be the effect on permissible working time if the technician used tongs, extending the mean body distance to 150 cm?

Solution

$$\begin{aligned}
 \text{a. mR/hr (I-131)} &= \frac{5000 \cdot 500 \cdot E \cdot f}{(60)^2} & .0116 E_1 &= 0.723 & f_1 &= 0.016 \\
 &= 694.4 E \cdot f & .0439 E_2 &= 0.637 & f_2 &= 0.069 \\
 &= 694.4 \times 0.3725 & .2985 E_3 &= 0.364 & f_3 &= 0.82 \\
 &= 258.66 \text{ mR/hr} & .0165 E_4 &= 0.284 & f_4 &= 0.058 \\
 & & .0020 E_5 &= 0.08 & f_5 &= 0.025 \\
 & & & .3725 & &
 \end{aligned}$$

$$\begin{aligned}
 \text{mR/hr (Au-198)} &= \frac{5000 \cdot 100 \cdot E \cdot f}{(60)^2} & .0022 E_1 &= 1.088 & f_1 &= 0.002 \\
 &= 138.88 \cdot E \cdot f & .0068 E_2 &= 0.676 & f_2 &= 0.01 \\
 &= 138.88 \cdot 0.4004 & .3914 E_3 &= 0.412 & f_3 &= 0.95 \\
 &= 55.61 \text{ mR/hr} & .4004 & & &
 \end{aligned}$$

$$\begin{aligned}
 \text{mR/hr (K-42)} &= \frac{5000 \cdot 25 \cdot E \cdot f}{(60)^2} & .0006 E_1 &= 0.31 & f_1 &= 0.002 \\
 &= 34.72 \cdot E \cdot f & .2736 E_2 &= 1.52 & f_2 &= 0.18 \\
 &= 34.72 \cdot 0.2742 & .2742 & & &
 \end{aligned}$$

Total Exposure

$$\begin{aligned}
 \text{I-131} &= 258.66 \text{ mR/hr} \\
 \text{Au-198} &= 55.60 \\
 \text{K-42} &= \frac{9.52}{323.78} \text{ mR/hr}
 \end{aligned}$$

(Solution Continued)

Practice Exercises--Solutions

Control of Ionizing Radiation

Module 6
Unit 2
Lesson 3

4. (Continued)

Total Body Exposure

$$3.0 \text{ rems} / 13 \text{ wk}$$

$$\frac{3.0 \text{ rems}}{13 \text{ week}} = 0.231 \text{ rems/week}$$

Total hours/week

$$\frac{0.231 \text{ rems}}{\text{wk}} \times \frac{\text{hr}}{0.324 \text{ rems}} = 0.71 \text{ hrs/week, with no shielding, } 60 \text{ cm--mean distance}$$

$$\text{b. mR/hr (I-131)} = \frac{5000 \cdot 500 \cdot 0.3725}{(150)^2} = 41.39 \text{ mR/hr}$$

$$\text{mR/hr (Au-198)} = \frac{5000 \cdot 100 \cdot 0.4004}{(150)^2} = 8.90 \text{ mR/hr}$$

$$\text{mR/hr (K-42)} = \frac{5000 \cdot 25 \cdot 0.2742}{(150)^2} = 1.52 \text{ mR/hr}$$

Total Exposure (150 cm)

$$\text{I-131} = 41.39 \text{ mR/hr}$$

$$\text{Au-198} = 8.90$$

$$\text{K-42} = \frac{1.52}{51.81 \text{ mR/hr}}$$

Total hours per week

$$\frac{0.231 \text{ rems}}{\text{week}} \times \frac{\text{hr}}{0.0518 \text{ rems}} = \frac{4.46 \text{ hrs}}{\text{week}}$$

An increase in distance by a factor of 2.5 is equivalent to a 625% decrease in exposure (inverse square law).

Lesson Outline

Control of Ionizing Radiation

Module 6
Unit 2
Lesson 3

5. An investigator is interested in releasing 200 mCi of Xe-133 through a hood. The air velocity in the hood is 50 ft/min, through an opening 15 in high and 3 ft wide. Determine the permissible release rate so that the concentration in the effluent from the hood stack does not exceed maximum allowable concentrations averaged over a 24-hour period.

Solution

$$\frac{\text{total flow of hood}}{24\text{-hr period}} = \frac{150 \text{ ft}}{\text{min}} \times 1.25 \text{ ft} \times 3 \text{ ft} \times \frac{1440 \text{ min}}{24 \text{ hr period}} \times \frac{2.83 \times 10^4 \text{ cc}}{\text{ft}^2}$$

$$\text{MAC (Xe-133)} = 0.3 \times 10^{-6} \mu\text{Ci/cc} \text{ (from table)}$$

$$\begin{aligned} \text{Maximum release for 24-hour} &= \frac{0.3 \times 10^{-6} \mu\text{Ci}}{\text{cc}} \times \frac{2.292 \times 10^{10} \text{ cc}}{24 \text{ hour}} \\ &= 6876.0 \mu\text{Ci}/24 \text{ hours (permissible rate)} \\ &= 6.876 \times 10^{-3} \text{ Ci}/24 \text{ hrs} \end{aligned}$$

Note: To release 0.2 Ci Xe would require

$$\frac{0.2 \text{ Ci}}{6.876 \times 10^{-3} \text{ Ci}/24 \text{ hrs}} = \underline{29 \text{ days}}$$

Self-Test

Nonionizing and Ionizing Radiation

Module 6

1. Define the following terms:

a. Photon _____
b. Wavelength _____
c. Frequency _____

2. Rank the following regions of the electromagnetic spectrum from highest to lowest frequency and indicate whether they are a form of ionizing or nonionizing radiation.

Rank	Region	Ionizing	Nonionizing
_____	a. Ultraviolet	_____	_____
_____	b. Radio frequency	_____	_____
_____	c. Infrared	_____	_____
_____	d. Visible	_____	_____
_____	e. Gamma	_____	_____
_____	f. X-Radiation	_____	_____

3. Describe the primary difference between ionizing and nonionizing radiation.

4. List a source and biological effect for each of the following types of radiation.

	Source	Biological Effect
a. Ultraviolet	_____	_____
	_____	_____
b. Infrared	_____	_____
c. Radio Frequency	_____	_____
	_____	_____

Nonionizing and Ionizing Radiation

Module 6

5. Describe the operation of a klystron unit. (Draw a diagram.)

Self-Test

Nonionizing and Ionizing Radiation

Module 6

6. Describe the operation of a typical laser unit. (Draw a diagram.)
Describe the potential hazards of a laser unit.

Self-Test

Nonionizing and Ionizing Radiation

Module 6

7. What is the power density (W/cm^2) of a laser unit with

- power output--0.5 Joules
- pulse length-- 10^{-4} seconds
- focal size--0.5 mm^2

8. List at least three (3) hazards associated with ultraviolet radiation.

9. Why is it necessary for ultraviolet measurements to approximate the actinic curve?

10. Describe the procedure used to determine the effective irradiance of an ultraviolet wide band source.

11. List three (3) factors which affect the accuracy of ultraviolet source measurement.

12. Briefly describe the effect of time and distance upon exposure to electromagnetic radiation.

Self-Test

Nonionizing and Ionizing Radiation

Module 6

13. What is the beam intensity of a laser at 135 cm with

- a. power output--0.5 watts
- b. beam divergence--0.80 milliradians
- c. beam diameter--2.0 cm

14. For each class of laser, describe the criteria for classification and at least one example of an operational requirement.

Class	Criteria	Operational Requirement
I	_____	_____
II	_____	_____
III	_____	_____
IV	_____	_____
V	_____	_____

15. What is the difference between the "near" and "far" fields of radio frequency radiation?

16. Calculate the radius of the "near" field for radio frequency radiation, given the area of the antenna is 100.5 cm^2 and the wavelength is 10.5 cm.

Self-Test

Nonionizing and Ionizing Radiation

Module 6

17. List at least five (5) causes of potential radio frequency hazard.

18. List at least two (2) types of detectors used for measurement of nonionizing radiation, their use, and basic principle of operation.

19. Define the following terms:

a. Atom _____

b. Proton _____

c. Neutron _____

d. Electron _____

e. Isotope _____

f. Radioactive Decay _____

g. Half-Life ($T_{1/2}$) _____

Self-Test

Nonionizing and Ionizing Radiation

Module 6

20. Complete the following table:

	Type of Radiation Particle/Photon	Charge +, -, 0	Atomic Weight amu	Penetrating Capability	Source (Machine, Decay)
Alpha					
Beta					
Photon					
Negatron					
Gamma					
X-radiation					
Neutron					

21. Define each of the following units of measure:

- Curie _____
- Roentgen _____
- rad _____
- rem _____

22. Calculate the dose equivalent for an alpha source with a reading of 150.0 μ rads at 10 cm, and the maximum exposure time which would not exceed 0.23 rems/week.

23. Describe the difference between an internal and external radiation hazard. Give an example of each.

Self-Test

Nonionizing and Ionizing Radiation

Module 6

24. List at least four (4) uses of ionizing radiation in the industrial setting.

25. List at least three (3) hazards associated with radiation use.

26. Describe the principle of operation of the G-M counter and the characteristic difference between the G-M counter, proportional counter, and ionization chamber.

27. Describe the principles of operation of the

a. Scintillation detector _____

b. Photographic device _____

c. Thermoluminescent device _____

28. What is the primary difference between a pocket dosimeter and pocket ion chamber?

Self-Test

Nonionizing and Ionizing Radiation

Module 6

29. Describe the purpose of shielding and an example of an appropriate shielding material for each type of ionizing radiation.

30. Briefly describe the steps which can be taken to control

a. Alpha _____
b. Beta _____
c. Gamma _____

31. Describe the procedure necessary to analyze

a. Surface contamination _____
b. Air contamination _____
c. Water contamination _____

32. List five (5) potential design problems which may exist in a facility using radiation.

Self-Test

Nonionizing and Ionizing Radiation

Module 6

33. What steps should be taken if a person has been splashed with a solution containing a gamma/beta emitter?

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

1. Define the following terms:

a. Photon Quantum of energy
 b. Wavelength Distance from peak to peak of a wave
 c. Frequency Number of vibrations/cycles per unit time.

2. Rank the following regions of the electromagnetic spectrum from highest to lowest frequency and indicate whether they are a form of ionizing or nonionizing radiation.

Rank	Region	Ionizing	Nonionizing
<u>3</u>	a. Ultraviolet	_____	<u>x</u>
<u>6</u>	b. Radio Frequency	_____	<u>x</u>
<u>5</u>	c. Infrared	_____	<u>x</u>
<u>4</u>	d. Visible	_____	<u>x</u>
<u>1</u>	e. Gamma	<u>x</u>	_____
<u>2</u>	f. X-Radiation	<u>x</u>	_____

3. Describe the primary difference between ionizing and nonionizing radiation.

Ionizing radiation has an energy level high enough to cause removal of electrons from atoms of absorbing materials; whereas, nonionizing radiation may cause electron excitation but cannot cause electron ejection.

4. List a source and biological effect for each of the following types of radiation.

	Source	Biological Effect
a. Ultraviolet	<u>Sun</u> <u>Welding operation</u>	<u>Erythema</u> <u>Conjunctivitis</u>
b. Infrared	<u>Molten material</u>	<u>Keratitis</u>
c. Radio Frequency	<u>Telecommunication</u> <u>Instruments</u>	<u>General heating</u> <u>General heating</u>

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

5. Describe the operation of a klystron unit. (Draw a diagram.)

The operation of a klystron is relatively simple. A stream of high speed electrons is produced at the cathode. The electrons travel towards the anode; and as they pass through the accelerating grid, they increase their speed. In the buncher cavity, the electrons are modulated by a microwave field into bunches. When the bunched electrons pass the catcher grid, the electrons slow down and microwave radiation is released and the microwaves are removed by the coaxial cable. Finally, the electrons are captured at the anode. The specific radiation released is dependent upon the dimensions of the tube, the dimensions of the cavity, and the velocity of the electrons.

For diagram, see Figure 6.1.6 in textbook.

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

6. Describe the operation of a typical laser unit. (Draw a diagram.) Describe the potential hazards of a laser unit.

As an example, the ruby laser is discussed.

The ruby laser is excited by optical pumping which lifts the system from the ground state of the chromium ion to one of the wide absorption bands. These absorption bands are optically wide in comparison to the sharp photon wavelength later emitted.

Once the absorption bands are excited, they quickly drop to a lower energy level by a radiationless transition. This lower energy level is actually split into two levels which are close together in energy. One of them is very long lived with a life of $T = 3$ milliseconds. One photon can be emitted by each state. The longer wavelength photon, which comes from the long-lived state, is more numerous. It is these photons which are emitted in a rapid pulse much shorter than the lifetime of the state which gives the high power of the ruby laser.

The ends of the ruby crystal act as the optical cavity. Once the critical level is reached, the presence of photons stimulates emission of other photons, and chromium ions return to their ground state again. Simultaneous emission of the photons forms the coherent light. This light is then transmitted through the transmissive mirror-like end of the ruby crystal tube. The entire sequence described requires approximately one-thousandth of a second. The coherent wave is produced because the critical level of photons required for stimulated emission is reached.

For diagram, see Figure 6.1.7 in textbook.

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

7. What is the power density (W/cm²) of a laser unit with

- a. power output--0.5 Joules
- b. pulse length--10⁻⁴ seconds
- c. focal size--0.5 mm²

$$\text{power density} = 5.0 \times \frac{1}{10^{-4}} \times \frac{1}{.05 \times 10^{-2}} = \frac{10^{-6} \text{W}}{\text{cm}^2}$$

8. List at least three (3) hazards associated with ultraviolet radiation.

- 1. Direct exposure--erythema
- 2. Ozone production
- 3. Carcinogenic catalyst
- 4. Vitreous humor fluorescences
- 5. Decomposition of chlorinated hydrocarbons.

9. What is it necessary for ultraviolet measurements to approximate the actinic curve?

Specific wavelengths of UV spectrum have a relative effectiveness with respect to affecting man (e.g., erythema causing). Measurements should reflect and weight exposure according to the effect on man (actinic curve).

10. Describe the procedure used to determine the effective irradiance of an ultraviolet wide band source.

- 1. Narrow band measurements taken
- 2. Calculate E_{eff} using formula $E_{eff} = \sum E_\lambda S_\lambda \Delta \lambda$
- 3. Compare to TLV levels

11. List three (3) factors which affect the accuracy of ultraviolet source measurement.

- 1. Instrument must match spectral range of UV source.
- 2. Water vapor in atmosphere.
- 3. Solarization or aging of lens
- 4. Directionality of meters and probes

12. Briefly describe the effect of time and distance upon exposure to electromagnetic radiation.

Time--Exposure directly related to time of exposure; as time decreases, exposure decreases.

Distance--"Inverse square law"

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

13. What is the beam intensity of a laser at 135 cm with

- a. power output--0.5 watts
- b. beam divergence--0.80 milliradians
- c. beam diameter--2.0 cm

$$I = \frac{E}{[(\pi/4)(a + \phi)]^2} = \frac{0.5 \text{ W}}{[(\pi/4)(2.0 + 135(8.0 \times 10^{-4}))]^2}$$

$$= 0.18 \text{ W/cm}^2$$

14. For each class of laser, describe the criteria for classification and at least one example of an operational requirement.

Class	Criteria	Operational Requirement
I	<u>Incapable of producing injury</u>	<u>None</u>
II	<u>May be viewed directly for short periods</u>	<u>Control beam direction</u> <u>Posting signs</u>
III	<u>Cannot be viewed directly</u>	<u>Eye protection</u> <u>Controlled area</u>
IV	<u>Cannot be viewed directly or exposure to reflected beam</u>	<u>Restricted area; fail safe system</u>
V	<u>Class II, III, IV encased to prevent emission of hazardous radiation.</u>	<u>Laser encasement</u>

15. What is the difference between the "near" and "far" fields of radio frequency radiation?

The "near" field has energy carried by magnetic and electric vector and may reflect interference of source with waves. "Far" field is primary an electric vector.

16. Calculate the radius of the "near" field for radio frequency radiation, given the area of the antenna is 100.5 cm^2 and the wavelength is 10.5 cm.

$$r = \frac{A}{2\lambda}$$

$$r = \frac{100.5 \text{ cm}^2}{2(10.5 \text{ cm})} = 4.786$$

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

17. List at least five (5) causes of potential radio frequency hazard.

1. Improper installation--Poor location, inadequate shielding
2. Unauthorized operating personnel
3. Ignoring operating defects; failing interlocks
4. Lack of personnel attention to operation
5. Poor maintenance schedule
6. Poor engineering design

18. List at least two (2) types of detectors used for measurement of nonionizing radiation, their use, and basic principle of operation.

1. Thermopile--UV radiation monitoring, absorption of UV radiation causes increase in temperature and increase in voltage production.
2. Photon devices--e.g., laser beam measure; absorption of photons converted to voltage difference, current, etc.

19. Define the following terms:

- a. Atom Smallest particle of an element which possesses the chemical properties of that element.
- b. Proton Particle which is found in nucleus; has a charge of +1 and a mass of 1 amu; determines chemical property of atom.
- c. Neutron Particle found in nucleus; has no charge and a mass of 1 amu.
- d. Electron Particle found outside nucleus of an atom; has -1 charge and a mass of 5.34×10^{-4} amu.
- e. Isotope Atoms with same number of protons but different number of neutrons.
- f. Radioactive Decay Spontaneous transformation of atom to reach lower, more stable energy level.
- g. Half-Life ($T_{1/2}$) Time required for 0.5 of isotopes present to decay to a new element.

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

20. Complete the following table:

	Type of Radiation Particle/Photon	Charge +, -, 0	Atomic Weight amu	Penetrating Capability	Source (Machine, Decay)
Alpha	<u>Particle</u>	<u>+2</u>	<u>4</u>	<u>Very small</u>	<u>Decay</u>
Beta Photon	<u>Particle</u>	<u>+1</u>	<u>0</u>	<u>Medium</u>	<u>Decay</u>
Negatron	<u>Particle</u>	<u>-1</u>	<u>0</u>	<u>Medium</u>	<u>Decay</u>
Gamma	<u>Photon</u>	<u>0</u>	<u>0</u>	<u>Deep</u>	<u>Decay</u>
X-Radiation	<u>Photon</u>	<u>0</u>	<u>0</u>	<u>Deep</u>	<u>Machine</u>
Neutron	<u>Particle</u>	<u>0</u>	<u>1</u>	<u>Medium</u>	<u>Fission</u>

21. Define each of the following units of measure:

a. Curie Unit of activity; 3.7×10^{10} disintegration/second

b. Roentgen Unit of exposure for X- and gamma radiation

c. rad Unit of absorbed dose

d. rem Unit of dose equivalent = $QF \times$ rad (R); takes into consideration various biological effectiveness

22. Calculate the dose equivalent for an alpha source with a reading of 150.0 μ rads at 10 cm, and the maximum exposure time which would not exceed 0.23 rems/week.

$$\text{rem} = 20 \times 150.0 \times 10^{-6} \text{ rads}$$

$$= 30 \times 10^{-4} \text{ rems}$$

$$\text{time} = \frac{30 \times 10^{-4} \text{ rems}}{0.23 \text{ rems}/40 \text{ hours}} = 0.52 \text{ hours or } 31.2 \text{ minutes}$$

23. Describe the difference between an internal and external radiation hazard. Give an example of each.

a. Internal--hazard which is being emitted from within body; e.g., alpha emitter absorbed through respiratory tract.

b. External--hazard which penetrates the skin; e.g., gamma radiation

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

24. List at least four (4) uses of ionizing radiation in the industrial setting.

1. radioactive tracers 4. radiographic analysis (X-ray)
2. radiation gauges 5. electron beam equipment
3. luminescent dials 6. activation analysis

25. List at least three (3) hazards associated with radiation use.

1. Direct exposure
2. High voltages of associated equipment
3. Presence of toxic substance formed because of radiation

26. Describe the principle of operation of the G-M counter and the characteristic difference between the G-M counter, proportional counter, and ionization chamber.

Ionizing radiation falls on chamber; ions formed in chamber from radiation, high voltage causes avalanche of ionization of all atoms in chamber; sequence registered on meter.

Difference: Meter reading not proportional to radiation present.

27. Describe the principles of operation of the

a. Scintillation detector Radiation interacts with phosphor causing production of light; light production measured with photomultiplier.

b. Photographic device Film sensitive to various types of radiation; developed exposure proportional to radiation present.

c. Thermoluminescent device Crystalline material exposed to radiation; causing "holes" in lattice structure; material then heated; electrons recombine and light is emitted; quantity of light emitted proportional to radiation present.

28. What is the primary difference between a pocket dosimeter and pocket ion chamber?

The pocket chamber requires a separate unit to be read; the pocket dosimeter does not.

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

29. Describe the purpose of shielding and an example of an appropriate shielding material for each type of ionizing radiation.

Shielding absorbs the radiation and reduces the exposure; e.g.,

Alpha--any airtight enclosure

Beta--aluminum

Gamma--lead

Neutron--water

30. Briefly describe the steps which can be taken to control

a. Alpha Enclosure--glove box

b. Beta Glove box, shielding, distance, decrease exposure time.

c. Gamma Shielding, distance, decrease exposure time.

31. Describe the procedure necessary to analyze

a. Surface contamination Smear test

b. Air Contamination Air sampling along with calculation of contaminant concentration

c. Water contamination Water sampling along with calculation of contaminant concentration

32. List five (5) potential design problems which may exist in a facility using radiation.

1. Porous surfaces

2. Dust collecting areas

3. Leakage around shielding

4. Hood design problems

5. Inadequate drainage systems for liquids

Self-Test (Answers)

Nonionizing and Ionizing Radiation

Module 6

33. What steps should be taken if a person has been splashed with a solution containing a gamma/beta emitter?

If personnel contamination is suspected, first identify the contaminated areas with survey meter. Do not use decontamination methods which will spread localized material or increase penetration of the contaminant into the body (e.g., by abrasion of the skin). Decontamination of wounds should be accomplished under the supervision of a physician.

Irrigate any wounds profusely with tepid water and clean with a swab. Follow with soap or detergent and water (and gentle scrubbing with a soft brush, if needed). Avoid the use of highly alkaline soaps (may result in fixation of the contaminant) or organic solvents (may increase skin penetration by contaminant).

Use the following procedures on intact skin:

- a. *Wet hands and apply detergent.*
- b. *Work up good lather, keep lather wet.*
- c. *Work lather into contaminated area by scrubbing gently for at least 3 minutes. Apply water frequently.*
- d. *Rinse thoroughly with lukewarm water (limiting water to contaminated areas).*
- e. *Repeat above procedures several times, gently scrubbing residual contaminated areas with soft brush, if necessary.*
- f. *If the radiation level is still excessive, initiate more powerful decontamination procedures after consultation with the radiation protection office.*
